vigor and forbade any transaction which bore even the remotest resemblance to usury. *Deuteronomy* allowed interest to be taken from the stranger (xxiii: 20); but some of the rabbis, basing their view on the verse in *Proverbs*, "He that by usury and unjust gain increaseth his substance, he shall gather it for him that will pity the poor" (xxviii: 8), inferred that no interest is to be taken even from the alien (*Baba metzia* 70b, and *Makkoth* 24a). Moses Maimonides' assertion that the taking of interest from aliens was made obligatory by Biblical law has generally been repudiated; Maimonides himself declared that this exaction had finally been abolished by rabbinical decision. With the increased participation of the Jews in money lending and the growth of capitalism a legal fiction in the form of a contract, known as a *shetar isska*, was developed whereby the taking of interest was made possible even from a Jew. This resort to legal fictions was often utilized in later Judaism as a means of modifying the rigor of the law to meet the realities of new social and economic development.

Political theory occupies a relatively insignificant place in Jewish religious doctrine. This is perhaps accounted for by the fact that the Jews have lived almost continuously under foreign rule. In ancient Israel the monarchic form of government was at first accepted with an aversion which was a natural result of rankling memories of oppression; but the idealized conception of David surrounded royalty with a poetic halo, and the perfect state of the future came to be associated with the rule of a scion of the house of Jesse. The prophets were interested in their country only when it aimed to achieve righteousness and justice. Postexilic Jewry adjusted itself to foreign rule and lived under its laws with resignation, altogether indifferent to ruling power. The Pharisees also combated the Jewish rulers of Israel whenever they violated the laws of the Torah. The yoke of Rome, "the Kingdom of Evil," was borne with reluctance, but a *modus vivendi* was finally worked out. The compromise of Jesus, "Render to Cesar the things that are Cesar's, and to God the things that are God's," was probably chosen by the great majority of the Jews. It was only a relatively small party, that of the Zealots, which refused to recognize any other master but God, and its rebellion against Rome resulted in the loss of Jewish political independence. The Jews began to lose interest in political life and to yearn for the days of the Messiah in which God will restore the

ideal world kingdom and in which Israel will enjoy full freedom and will have the rank of *primus inter pares* among the nations. In the meantime the Jews felt that they were in Galuth (Diaspora); a Palestinian teacher of the third century maintained that God made the Jews swear that they would not revolt against the nations among whom they were destined to live and promised that the latter in their turn would not oppress them over much (*Kethuboth* 111a). With this the principle of loyalty toward the state was established, provided it did not jeopardize the integrity of the Jewish religion. The Babylonian teacher Mar Samuel coined the expression *Dina demalchutha dina*, which made the civil law of the state valid, thus enabling the Jews to submit to alien legal rule and to take the oath in alien courts with an easier conscience.

Ancient Jewish life was not devoid of a warlike spirit. Yahweh was characterized as a "man of war." The prescriptions of the Torah with regard to the extermination of the Canaanites and the story in the book of *Joshua* describing the manner in which it was carried out were extremely cruel expressions of the resentment engendered by the fact that the absorption of the Canaanitish population was slower than anticipated. The progress of religious ideas among the Jews is attested by the peaceful spirit that pervades the stories of the patriarchs and by the Deuteronomic prescriptions with regard to humanizing warfare. Despite the fact that the prophets lived in mortal dread of the Assyrian military power they proclaimed the ideal of eternal peace. The ideal ruler of the future, it was foretold, would be a prince of peace. Jewish tradition transformed King David from a warrior into a pious bard who leads his herd in the ways of God. The Talmud repudiates every war of aggression and sanctions only wars of defense. When the Hasmoneans wished to build the Jewish state on a military basis, the Pharisees opposed them with their pacifist ideal. The leaders could not prevent the people from giving free vent to their passions in bloody revolts, but the latter persistently clung to the Messianic ideal and regarded their struggle against Rome as the birth throes of a better and more ideal day. The destruction of their political independence robbed the Jews of all military ambitions; the state laws even excluded them from military service. World peace was and still is one of the most fervent of the Messianic hopes of Judaism.

The family in Judaism is considered as the corner stone of Jewish communal life. Its pur-

pose is not only to propagate but also to promote moral adhesion between its component members. Marriage is ordained by God; therefore woman, who like man was created in His image, was allotted her place in this world in order that she might be "a helpmeet for him." Polygamy was permitted, although monogamy was in very early times the customary form of marriage. For western Jewry the principle of monogamy was established by a ruling of Gershom ben Jehuda in Mainz (c. 1000) and since then has had the force of a law. Although divorce is allowed it is looked upon with disapproval in some circles and in general is regarded as a painful experience. About the time Christianity arose the prevailing conception was that divorce was forbidden by divine law—a belief which has been preserved by the Roman Catholic church down to our own time. The Pharisees, on the contrary, sanctioned divorce; there was difference of opinion among them with regard merely to the conditions under which it was justified. According to Biblical law a woman was powerless to prevent her husband from divorcing her; but the Talmud and later the mediaeval rabbis insisted that some consideration be given to the woman's wishes. The legal status of woman in Jewish law is far below that of man; as, for instance, in her right to inherit and to bring suit at court. Even her domestic duties are prescribed. Despite all these disqualifications woman was never regarded as merely the property of man and as completely without rights, as were Babylonian, Greek and Roman women. In this respect social customs under the quiet influence of religion were far more advanced than the codified laws. In the course of ages they have assigned to woman a high social plane, which she still maintains in the Jewish family. The close intimacy of Jewish family life has always and everywhere been recognized as a special characteristic of Judaism.

Learning and education were particularly emphasized in Judaism; throughout Jewish history learning has in fact been the most admired of accomplishments. The Pentateuch enjoins all parents to give religious instruction to their children; and in post-Biblical Judaism the unique attempt was made to educate the whole people in its religion through the institutions of the synagogue and the school, or *beth ha-midrash*, which usually existed in connection with it. This emphasis on learning, which is responsible for the overdeveloped intellectuality of the Jew, resulted from time to time in the creation of a

social cleavage between the intellectual aristocracy and the more uncultivated masses. In Talmudic times a division appeared between the learned and the "people of the land" (*am ha-aretz*), whose strict observance of the Law was questioned and who as a result were not trusted as witnesses and with whom intermarriage was discouraged. This overemphasis upon learning served also to provoke reaction in the form of mystical movements, which had a greater appeal to the masses, and was likewise one of the prime factors in the rise of Chassidism.

The practise of the Jewish religion has had considerable influence upon the characteristics of the Jews, their social behavior and their social and economic status. The observance of the numerous regulations imposed on the Jew by his faith has led to a strong disciplining of the will as well as to a marked practical rationalization of life. Above all it has given the Jew a feeling of otherness, a feeling that he is a stranger. Observances such as the dietary laws have prevented him from accepting alien hospitality; his Sabbath and festivals with all their attendant rites have marked him off from the surrounding world. This feeling of otherness was further strengthened by the Jewish belief in the doctrine of the election of Israel; even as early as the Hellenistic period in Alexandria enemies of the Jews continually attacked them for their exclusiveness. On the other hand, the belief that they are a chosen people has contributed greatly to the continued survival of Judaism despite all persecution and hostility.

There has been much theorizing as to the effect of Judaism on the rise of capitalism and the capitalist spirit. The most impressive attempt of this kind is Sombart's *Die Juden und das Wirtschaftsleben* (Leipzig 1911, tr. by M. Epstein, London 1913). Sombart finds the spirit of Judaism identical with the spirit of capitalism. Judaism for him is characterized by "the preponderance of religious interests, the idea of divine rewards and punishments, asceticism *within* the world, the close relationship between religion and business, the arithmetical conception of sin, and above all the rationalization of life." These characteristics, he claims, have developed in the Jews those traits which have made them one of the chief factors in the rise of modern capitalism. In the light of careful study of the sources this view is completely one-sided and exaggerated. Only this can be proved: the traditional mode of life of the Jews enabled them to participate in capitalistic activities and their

religion did not hinder them from exploiting these opportunities, notwithstanding the fact that the spirit of both the Old and the New Testament is diametrically opposed to the spirit of capitalism. It is not Judaism but the individual Jew who has contributed to the development of the modern economic system, aided as he has been by external and purely historic forces and circumstances. Max Weber also traces the participation of the Jews in trade and money lending to the influence of their religion. According to him the practise of rabbinic Judaism with all its ritual precluded the possibility of engaging in agriculture. His religious duties made it necessary for the Jew to live in a city close to other Jews and to Jewish institutions and thus he came to engage in trade. Moreover the emphasis placed on learning led many Jews to money lending as the occupation which could provide them with the greatest amount of leisure for study of the law. Weber failed to see, however, that similar conditions in Palestine and Babylonia did not prevent Jews from engaging in agriculture.

The modern period which brought about Jewish emancipation caused a serious crisis in Judaism, from which it has not yet emerged. The existence of the Jewish traditional mode of life was threatened from three separate quarters. The greatest menace issued from the changes in economic and social conditions. Mercantilism and early capitalism opened new fields to the Jewish enterprising spirit. The newly risen middle class, which began to play an important part in all countries, was inspired by the ideals of the Enlightenment and emancipating itself from traditional religion welcomed into its ranks the intelligent, enterprising and practical Jews. For two centuries Judaism had been dominated by a gloomy philosophy in which this world was regarded as a vale of tears; it was weighted down with the yearning for redemption in the world to come. Now the Jews began to take a deeper interest in their earthly existence. They wished to compensate themselves fully for all the deprivations they had suffered in the course of the centuries. They were ready even to renounce their belief in eternal salvation and to discontinue their observance of the dietary laws and the Sabbath in favor of worldly well being. In this way the traditional mode of life that had existed for ages was destroyed.

The second danger was of an intellectual nature. Moses Mendelssohn's philosophy of enlightenment completely rationalized and lev-

eled Judaism by identifying it with natural religion. It was "revealed law" instead of revealed religion which now became the center of Judaism. Therefore the followers of Mendelssohn regarded Judaism as nothing but a mass of wretched, mechanical restrictions which perpetuated the segregation of the Jews, a situation which they very much resented. They believed that piety and religion were not essential to Judaism; and when Schleiermacher, for whom they had great admiration, declared that the basis of religions was what he called *das Religiöse*, they were hard put to find this basis in their own faith because it was buried under the crushing weight of a rigorous formalism. Thus it came about that dogmatic Judaism, which for thousands of years had been preserved intact, became subject to violent criticism. The leaders of rabbinic Judaism were incapable of facing the new problems intelligently. Instead they insisted upon an even stricter observance of tradition, ignoring the fact that Chassidism in its initial stages was a movement concerned with the inner liberation of the Jews.

The political situation also appeared as a source of danger. Napoleon was confronted by the problem whether it was possible for him to compromise with Judaism in the same way as with the Christian churches; in other words, whether the Jews were to be tolerated as a religious group or whether they were to be suppressed as a national unit. The solution which he himself offered was that the Jews were to eliminate all national elements in their tradition and retain only their religious ideals. The Great Sanhedrin gladly accepted this solution, which acquired authoritative force in the subsequent struggle for emancipation. The unity of Judaism, which had persisted despite the Dispersion, was disrupted by a political power and the Jews now came to be differentiated according to the countries in which they lived. For the first time the absence of a common religious authority began to be felt; and the Hebrew language, which up to that time had served as a cultural and religious bond between Jews, made way for the languages of their adopted countries.

It was under the influence of these conditions that Reform Judaism arose in Germany. The early reformers were concerned with making Judaism more "presentable" to western civilization. Impelled by the desire for political emancipation and the fear lest their patriotic sentiments for the land in which they were residing be questioned, they tried to make Judaism as

similar as possible to the religion of their neighbors. The first attempts to cope with the situation were inspired by Protestantism and were confined exclusively to the aesthetic transformation of the synagogue service. More decorum was introduced, the organ was brought in, German prayers and a German sermon were added. Later the prayers concerning the national and political aspirations of the Jews were excluded from the Reform prayer book.

The theoretical basis for Reform Judaism was supplied chiefly by the writings of Holdheim and Geiger. A great impetus to modernization was furnished also by the romantic movement, which discovered the concept of "historical Judaism," and by the new "science of Judaism" founded by Leopold Zunz. Zunz began to study Judaism systematically and in the spirit of critical science. He succeeded in vitalizing its spirit, in giving greater significance to its institutions, in establishing the validity of its doctrines and in lending greater importance to its educational system. Jewish theology, nourished by the spirit of idealism, burst into new flower in this fertile soil. Laying special emphasis upon the prophetic conception of the unity of the human race and upon the Messianic ideal it therefore demanded, besides the purity of faith, religious sentiment and the permeation not only of the ceremonial but of all Jewish life with warmth and inner content. Geiger emphasized also the historic character and the relativity of religious phenomena. He insisted upon a historical approach to religion and upon a return to the prophetic purity of idea and form. He conceived of the Dispersion of the Jews as a means of fulfilling their Messianic mission and of their emancipation as a progressive step in that direction. The Reform movement spread to other countries of western Europe and to the United States, where it was propagated by Isaac Mayer Wise. The extreme element of Reform Judaism has scrapped the entire Jewish ritual—not merely its religious mystical elements. In a few instances the practise of exchanging pulpits between Christian and Jewish ministers has been introduced and perhaps the only difference between them is that concerning the attitude toward Jesus. On the other hand, other elements of Reform Judaism have under the stimulus of the Jewish national movement acquired a much more national orientation than that of the early reformers.

During the early days of the reform movement Jewish orthodoxy in Germany found its leader in Samson Raphael Hirsch. Hirsch contrasted

revealed Judaism with the spirit of the times and looked upon the Diaspora as a school of purification established by God and upon the Jew as the bearer of the mission to regain his relationship with God through the fulfillment of the prescribed duties. Conservative Judaism has developed under the leadership of men like Hildesheimer in Berlin and Solomon Schechter in New York; its aim is to modernize the Jewish religion and at the same time to preserve its traditional character in all the essentials. The great mass of eastern European Jews still adhere to strict orthodoxy although here too the revolt against tradition made itself felt in the *haskalah* (enlightenment) movement, especially during the post-war period with its complete disruption of Jewish political and economic life. The most militant elements of orthodoxy have united in the Agudath Israel, which aims to perpetuate the rigorous regulation of Jewish life by rabbinic Judaism. It combines the orthodox elements of eastern Europe, especially the important Chassidic rabbis, the political orthodoxy of Hungary and Germany and the western European orthodoxy of the school of Samson Raphael Hirsch.

Under the influence of neoromanticism at the end of the nineteenth century a religious revival took place. The Reform movement grew more vigorous, and thinkers like Herman Cohen and Martin Buber gave a deeper meaning to the conception of God, communal ideals and Messianism. Simultaneously a great upheaval took place among the Jews in the east. A large number emigrated to America and brought along with them their religious ideals, which in turn influenced Jewish life in the old countries, now drawn into the general non-Jewish movements. The Jewish masses with their national attitudes, intense experiences and sentiments and their dreams and hopes nourished by Chassidism became a decisive factor in Judaism, and their views and customs gained a foothold in the communities of the west. The national character of the Jewish religion and ethics was emphasized by such thinkers as Peretz Smolenskin and Ahad Ha-am. World Jewry, which had been divided by differences of religious opinion and national cultural affiliations, was once more furnished by nationalism with a common platform. Zionists propagandized their views in all camps. The revival of the Hebrew language became a part of its program; new Hebrew and Yiddish literatures sprang to life. New literary, historical and religious values were created which established a bridge between the lives of eastern and western

Jewry. At first the Jews of the west repudiated these values, but their own increasing decadence and the growing influence of east European Jews helped to revive Judaism in the west.

With the increasing participation of the Jews in the political, social, economic and cultural life of the countries of their adoption Judaism no longer completely dominated their entire life but constituted only one of their interests. Furthermore industrialization and antisemitism have driven the Jews to the large cities, where they are exposed to the pressure of intellectual and cultural assimilation. Where they live in small groups they are constantly decimated through mixed marriages and conversions. The following of the orthodox ritual has become increasingly difficult with modern economic conditions. The observance of the Sabbath prevents a Jew from receiving employment in most government offices and with other Christian employers. Economic disadvantages are also incurred by the Jewish shopkeeper who is forced to observe both Saturday and Sunday. The observance of the dietary laws results in an increase in living costs, and the desire to transmit traditional Judaism to the young generation results in both economic and spiritual complications. It is perhaps due to these factors that except in eastern Europe Judaism has retained its strongest hold on the upper and middle classes and has relatively little influence on the mass of Jewish workers.

The historic significance of Judaism is very apparent. Through Christianity and Mohammedanism it has become one of the most important factors in western civilization. Its "ethics," says Max Weber, "still largely forms our present European and Near Eastern religious ethics" (*Gesammelte Aufsätze zur Religionssoziologie*, vol. iii, p. 6). The Christian church, according to Harnack, was largely able to carry on its work because the soil was prepared for it by Judaism. At the birth of Christianity there were religious communities to be found in the large cities. Knowledge of the Old Testament was widely disseminated, and it was quite easy for the Christian church to adapt for its purposes the existing Jewish catechisms and liturgies. The people had already been accustomed to the religious service and to the regulation of their private lives. Christianity inherited from Judaism an impressive apologetic for monotheism, historical teleology, including the day of judgment, as well as a system of ethics which involved the obligation of individual propaganda. Christian ethics is also based upon the Jewish. St. Paul of course

wages war upon the Law, but what he opposed was only the ceremonial law. He accepted the moral law of Judaism and this gave the church the opportunity to transform its original hostile attitude toward this world into an affirmation of the social and political life. In the body of Jewish tradition Christianity found the pattern for a well integrated national life which could serve as a guide to all the complicated problems offered by political, social and economic activities.

Judaism advanced the idea of a legal order that was established by God and of a governmental power designed to issue laws and to punish their transgression. It provided Christianity with the weekly festival and rest day, notwithstanding the many controversies called forth in the church by the character of the Sunday celebration. Easter and Pentecost also were derived from Judaism, even though both were given a Christian reinterpretation. From the synagogue Christianity borrowed not only the idea of a spiritualized religious service but also a great deal of material for its ceremonial rites and liturgy; above all, the institution of recitation and the expounding of the Scriptures. The Christian communities were fashioned after Jewish models and maintained the same welfare organizations. The word alms itself originated in the Greek translation of the Bible. The church tithe is but a continuation of that of Biblical times.

Most important of all was the Christian acceptance of the Jewish Bible. "Had it not accepted the Old Testament," says Weber, "there would have arisen on the soil of Hellenism pneumatic sects, mystery cult societies, and the worship of Kyrios Christos, but there never would have been a Christian Church and a Christian daily ethics, as there would have been no basis for their existence." It was the Old Testament which proclaimed the God of creation and of the covenant and became the foundation and the confirmation of the New Testament. This is evident from the fact that since the days of Marcion the church has repudiated all attempts to separate the New Testament from the Old.

The fact that the Jews preserved the Old Testament in its original text and studied it continually had a certain influence on all phases of Christianity. Christians were able to apply to their Jewish neighbors for solutions of difficulties in dogma, and from this it can readily be seen that the church was not wrong in accusing the Jews of playing into the hands of the her-

etics. The great period of Biblical influence came with the Reformation, which not only preached a repudiation of dogma in favor of Scripture and made of the Bible a popular book but also had it translated directly from the Hebrew with the assistance of Jewish commentators.

The Biblical idea of a "general priesthood," or of a people of priests, required vindication in the daily life of the individual, and so beside the Sermon on the Mount the Decalogue acquired equal importance in the eyes of the Christian, inasmuch as it contained the principle of divine and brotherly love. The Old Testament became the final court of appeal concerning questions of right, customs, family and professional life. Moreover its acceptance of this world had a determining influence on the new concepts of the state and society. The constitutional history of Israel was the inspiration for political philosophers of all schools until the eighteenth century. Calvinism also brought back into Protestantism the glorification of worldly activity, an ideal which hitherto had been absent because of the influence of Pauline doctrines. This sentiment found its highest expression in the Bibliolatry of Puritanism, which wished to identify itself with the spirit of the Bible but was forced by the sad experiences of religious persecutions and civil war to pay attention to only one aspect of Biblical piety. Thus the Puritan concept of God took on an austere severe character, something which had long been discarded by Judaism and Christianity. Once more the god of war who punishes and persecutes ruthlessly, who orders the annihilation of one's enemies without mercy, became an ideal. The Puritans regarded themselves as instruments of God's will and therefore thought it their duty to assert themselves in life. They took over to a great extent the laws of the Old Testament and also surrounded the Sabbath with a new legalism which was as stringent as that of the Talmud.

Mohammedanism like Christianity branches from Judaism. The Arabs became acquainted with Jewish doctrines not only directly but also indirectly in Christian form, and it is difficult to demarcate exactly the two spheres of influence. Mohammed proclaimed to pagan Arabdom the most rigid monotheism in all its old Biblical austerity. He based his ethics upon the Decalogue and from Judaism he borrowed the regulations with regard to what is clean and unclean and the prohibition of foods, excoriating

transgression as a heinous crime. The Jewish custom of praying he also assimilated into Islam. The mosque is patterned after the synagogue. The Mohammedan weekly day of rest is devoted to prayer, recitation and sermons, although work is not prohibited on that day. Mohammed, however, did not adopt the Bible for Islam. He regarded himself as the "seal of prophecy" and proclaimed the Koran as the confirmation and the divine substitute for the Jewish Scriptures. Nevertheless, his attachment to the past is indicative of a detailed knowledge of post-Biblical Jewish lore, for the Sunna, which is regarded as a source of authority beside the Koran, corresponds to the role of tradition in Judaism.

JUDD, ORANGE (1822-92), American agricultural journalist. Judd ranks with Henry Wallace and S. A. Knapp as a popularizer of agricultural science. A native of rural New York and a graduate of Wesleyan University, he became editor in 1853 of the *American Agriculturist*, published in New York. Subsequently he edited the *New York Times* farm section and the *Prairie Farmer* and the *Orange Judd Farmer*, both of

which were published in Chicago. He was extremely successful as both editor and publisher. At a time when American agriculture was undergoing great changes Judd preached the value of scientific farming and encouraged the introduction of agricultural machinery. He believed in the liberal use of advertising, was aggressive in exposing popular swindles, sponsored agricultural exhibits by his readers and in 1857-58 distributed sorghum seed from Europe among many thousand farmers. The insistent efforts of Judd and the financial cooperation he secured led the Connecticut legislature in 1875 to establish the first state agricultural experiment station in the United States. He became a trustee of Wesleyan University and made the institution a gift of Orange Judd Hall of Natural Science. Judd experimented with building modernized houses at low cost and published the plans. In the days of the Grange and populism he insisted that the solution of the farmers' problems lay in better farming and not in agrarian politics—an attitude characteristic of his concentration on the practical aspects of agriculture.

JUDGMENTS. The aim of every civil proceeding before a judicial tribunal is to obtain from it a pronouncement upon the right asserted by the plaintiff. That pronouncement when vested with the necessary legal formality becomes the judgment of the tribunal. A judgment (the decree of equity and admiralty courts) is therefore an expression of the court's decisory power: it represents a conclusion reached by the court after the application of the law to the facts—a conclusion moreover stamped with the authority of the state, which as indicated either by the words of the judgment or by necessary implication from its phrasing stands ready to lend its aid in translating the conclusion into terms of social effectiveness.

It is a principle dictated by the public policy of ordered society that a matter once finally determined by judgment shall not again be the subject of legal controversy. This principle is expressed in the Roman law maxims *Ne bis de eadem re sit actio* and *Res judicata pro veritate accipitur* and finds similar acceptance in the Germanic law. But the Roman judgment is in general binding only upon the parties, while the

Germanic judgment as the product of a judicial assembly is binding upon all who have been present at its rendition. Moreover the judicial proceeding of republican Rome because of its two stages of *jus* and *judicium* has a certain conclusive effect even prior to judgment. This effect attaches to the *litis contestatio*, or authentication of the parties' will to litigate, occurring before the praetor *in jure* and accomplished in the *legis actio* period by ritualistic acts, in the formulary period by the parties' acceptance of the written formula defining the activity of the judex. For with the *litis contestatio* the plaintiff's right of action ceases: it has become merged in the right to a *judicium*; that is, to a judicial hearing and decision. This operation was known as *consumptio*: the right of action was deemed to be consumed or extinguished in the generation of the new right. But when judgment is rendered in the cause the new right itself ceases to exist, for it in turn becomes merged in the judgment. Thus either the fact of *litis contestatio* or the fact of judgment may be a bar to future litigation. In the formulary procedure this bar must be effectuated for the most part by exception: the *exceptio rei in iudicium deductae* in the one case, the *exceptio rei judicatae* in the other. It is maintained, however, that ultimately the two *exceptiones* became combined in a uniform *exceptio rei judicatae vel in iudicium deductae*. In the imperial procedure, with its effacement of the distinction between *jus* and *judicium*, there is also effaced the intermediate *consumptio* of the former system, and the original right of action continues until merged in the judgment—a rule governing in modern procedure. The principle of conclusiveness of the judgment naturally prevails also in modern law. The French law speaks of the *chose jugée*, the Italian of the *cosa giudicata* and the German of *materielle Rechtskraft*, while Anglo-American law by a direct use of the Roman term speaks here of the doctrine of *res judicata*. In virtue of this doctrine the fact of the prior judgment "has a twofold operation. Not only does it estop the parties from afterwards controverting any question or issue thereby decided, but it also bars the party who has obtained relief thereby from subsequently receiving the same relief against the same party" (Bower, G. Spencer, *The Doctrine of Res judicata*, p. 175). The first of these functions comes under the traditional head of estoppel by record; the second is identified by the term merger, inasmuch as the original claim is absorbed by or merged in the judgment, in Roman terminology "con-

sumed" by the judgment. In both respects therefore the judgment if valid concludes the same parties from relitigating the same question in a fresh proceeding and concludes also their privies; that is to say, those claiming under them. But conclusiveness in this sense does not in any modern legal system imply that the judgment may not be reexamined by competent judicial authority in a special proceeding for that purpose within the time prescribed by law. In other words, the doctrine of *res judicata* in no way collides with provision made by the state for appeals or other means of review. Thus a judgment terminating a particular proceeding is final in one sense upon its rendition, but in another sense it is not final until the remedies available against it have been exhausted or the time for their exercise has passed—a distinction which the terminology of Anglo-American law, unlike that of the continent, fails to reflect.

The character of the Roman judicial proceeding until the imperial period excludes the notion of complaint made to higher authority against the judgment. Since in the periods of *legis actio* and formula the proceeding consists essentially of private arbitration authorized and regulated by the state, in which the function of pronouncing judgment lies with the private citizen serving as judex, the constitutional partition of powers is such as to prevent any appeal from the *sententia* of the judex. A means, to be sure, is provided for opposing orders of the magistrate (*intercessio*); but as against the valid *sententia* there is no recourse save that which arose in the formulary period from the presence of the praetorian remedy of *restitutio in integrum*, available, for instance, on account of duress exercised against judex or party, corruption of the judge or the fact that the judgment was based upon perjured testimony or forged documents (Wenger, p. 202). In the Germanic law the judgment once pronounced is even less open to question than in the earlier Roman law but for different reasons. In the Germanic popular judicial assembly each of the freemen present has a voice in the decision, but as an aid in the transaction of business there is a committee of one or more persons charged with the duty of finding judgment (*Schöffen*, *scabini*). If their proposal of judgment is assented to by the assembly, then the presiding officer pronounces this finding as the judgment of the court. But before the formal pronouncement it is open to either party or any other member of the assembly to impeach (*schelten*, *blasphemare*) the proposal by denounc-

ing it as bad law. In that event the impeacher must offer a substitute proposal. The controversy thus arising as to which of the proposals is correct is always a personal one between finder and impeacher (Planck, p. 19). The decision of this controversy among some Germanic peoples is by judicial duel; in the later period it appears to have been obtained by consultation of some other court, which was presumably a purer and more secure source of legal knowledge (Planck, p. 21). The decision is for the information of the court of the original controversy, which renders judgment in conformity therewith.

The Germanic judgment, unlike the Roman, does not pass on the merits of a cause: it is a proof judgment that under the prevailing system of formal, unilateral proof determines which party has the right of proof, what he is to prove and which of the recognized means of proof he is to employ. But inferentially it also declares the consequences of making or failing to make the proof in question and hence was said to be "double-tongued" (*zweizüngig*). Compliance with the judgment is insured by a contractual undertaking forthwith exacted from the parties, the so-called judgment fulfilment promise.

To the existence of *res judicata* in Anglo-American law it is essential that the court shall be in no respect lacking in power to render the judgment in question; for otherwise the judgment is void. "Broadly speaking, nullity of judgments results from one or other of the following causes: 1. Want of a legally organized court or tribunal; 2. Want of requisite jurisdiction over the subject matter or the parties or both; 3. Want of power to grant the relief contained in the judgment" (Freeman, *Law of Judgments*, vol. i, sect. 325). And, subject to what will later be said, a void judgment has no legal effect for any purpose. Legal inexistence of the null judgment was also the rule of the Roman law, which, however, extended its category of nullity far beyond the Anglo-American, since it held to be null even the judgment which was in plain violation of a rule of law (*contra jus constitutionis*). By the generally accepted view the case was otherwise in the Germanic law: here once a judgment had been formally pronounced its legal existence could never be challenged. This characteristic of the Germanic judgment has left its impress upon the continental procedure of today. For although the latter recognizes widely the conception of nullity, most of the defects which in Anglo-American law would render the judgment void pass in that system

beyond the reach of attack, unless within the designated time there is employed a proper proceeding to contest the judgment. In Anglo-American law the conceptions of nullity and invalidity are identical. Hence it recognizes, on the one hand, the erroneous judgment open to question only by an appropriate proceeding specifically directed against it and, on the other, the void judgment open to contest at any time and in any manner. Correspondingly, distinction is made between direct attack, which signifies a contesting of the judgment by the specific means furnished by law for that express purpose, and collateral attack, which denotes attack made in a collateral proceeding. By the rule generally followed in the United States collateral attack by a party or privy is usually limited to the situation where the invalidity appears on the face of the record. But a stranger to the original proceeding may not only use against the judgment every ground open to the party collaterally but is also permitted to show generally that the judgment was obtained by fraud or collusion. In every case where the judgment bears upon its face the evidence of its own invalidity the conception of invalidity as legal inexistence is absolute. But where the invalidity is not so disclosed and yet may be established by extrinsic evidence, as in the case of a creditor alleging fraud or collusion, the judgment is not void in this absolute sense. Such a judgment is commonly referred to as voidable. Until its invalidation by judicial decree it is not destitute of legal existence, since, for one thing, it may give good title to an innocent purchaser.

Some few cases excepted, the judgment requires to be attended with the means of carrying it into effect; in other words, the state must provide means of execution. But this may assume a variety of forms dictated primarily by the varying character of the judgment, which may be one binding the defendant generally (judgment *in personam*), binding him only as to specific property (judgment *quasi in rem*) or binding specific property as against all the world (judgment *in rem*). Viewed from another angle the judgment may require the payment of money, the delivery of personal property, the transfer of the possession of real property or the doing or not doing or the suffering to be done or not done of specific acts of many different sorts. Of principal importance is the execution of money judgments, which assumes various forms.

The primitive form of execution is the untrammelled exercise of self-help steps taken by the

creditor to seize the debtor's person or property to hold as coercive security for the satisfaction of his claim. Indeed a relic of this very thing persists today in the Anglo-American law of distress. But in both the Roman and Germanic law, with the opening of documented history, marked by the Roman Twelve Tables and the Frankish *lex salica*, this personal activity of the creditor is already subjected to an important measure of judicial regulation—a measure which the subsequent development tends more and more to transform into the general requirement that steps by way of execution shall be preceded by judicial judgment. Yet in so far as the state comes to require judgment as a prelude to execution it may still leave the actual work of execution to the creditor. This was the case in the Roman *legis actio* period; it was largely the case in the Germanic system. In the Roman law it is the judgment itself that is the basis of execution, subject, however, until imperial times to special ratification (*legis actio per manus injectionem*) or authorization (*actio iudicati*) on the part of the state. In the Germanic law again the judgment is a remoter condition of execution. What is executed here is not the judgment at all but the judgment fulfilment contract, the promise to prove or pay, which the event of the proof directed by the judgment has turned into an unconditional promise to pay. The early execution may affect both person and property. Measures against the person loom large in the law of the Twelve Tables: the Roman creditor of this period is entitled to put his debtor to death or sell him *trans Tiberim*. By the *lex poetelia* this right is cut down to that of holding him in debt servitude. A generally applicable form of execution against property does not appear in the Roman law until the formulary period. Then it comes as the praetorian *missio in bona*, whereby the aggregate property of the debtor is made available not for a particular creditor but for his creditors as a class. Postjudgment execution against specific property (*pignus in causa iudicati capium*) is a later institution originating in the time of Antoninus Pius. In the Germanic law the person of the debtor may be an object of execution, but the creditor has no such general right in this regard as is encountered in the early Roman law. His right for the most part is associated with the penalty of peacelessness or outlawry, to which is exposed the debtor guilty of contumacy, as in persistent refusal to give the judgment fulfilment promise. Normally it is the goods of the debtor against which execution is

directed; but this situation is modified in the later Germanic development.

For English law, since its emergence as an individual system, the relation of execution to judgment has been in general the same as it is today, although the case is different as to the measures available on execution. The feudal principle stood in the way of execution against the person, for this entailed upon the lord the loss of his vassal's services. It was opposed also to the subjection of land to the payment of debts, for this would disturb the feudal nexus. Hence the common law restricted execution against the person to cases where the judgment debt arose out of a forcible injury to the plaintiff, involving a breach of the king's peace, and allowed no ordinary money execution to go against land. But largely as a result of various statutes beginning in 1267 execution by way of imprisonment of the debtor came to be open very generally to the creditor and long continued to be an oppressive feature of the administration of civil justice. Some restraint upon the creditor, however, was exercised by the rule which forbade his subsequent resort to the property of a debtor whom he had thus caused to be imprisoned. In the matter of land the old restriction was broken into by the Statute of Westminster II [13 Edw. I, c. 18 (1285)], which enabled the creditor by writ of *elegit* in case of insufficiency of personal property to take possession of a moiety of the debtor's land for the purpose of satisfying the debt out of its profits. Personal property, however, could always be proceeded against and sold under the writ of *fiat facias*. Such was the case as to judgments of the common law courts. The Chancery, which professed to act only *in personam*, relied in the main upon punishment for contempt of court. But it also exercised the power of causing a recalcitrant party's goods and lands to be seized by writ of sequestration as a means of coercion and for the purpose of applying the profits to the satisfaction of the creditor. It should be noticed also that the creditor with a common law judgment might have a claim of equitable cognizance, for the equitable interests of a debtor with slight exception were beyond the reach of common law execution. The aid of the court of equity under such circumstances has come to be known as equitable execution.

The later development both in England and America has introduced marked changes. Of imprisonment for debt, apart from that incident to the contempt process of courts of equity,

merely attenuated fragments are left, reserved in general for cases of fraud and tortious acts. In the United States by a rule whose history dates back to a British act of Parliament of 1732, applying to the American colonies (5 Geo. II, c. 7) and recognizing a practise already obtaining in at least some of them, land is everywhere answerable for the owner's debts, generally by sale but in some jurisdictions by extent; that is to say, allotment to the creditor at an appraised value. In England the case is not quite the same, yet the creditor after proceeding by *elegit*, which now affects the whole instead of a moiety of the debtor's land, may by application to the court cause the land to be sold in satisfaction of the debt. Courts in the exercise of equitable jurisdiction have commonly been given the added power of enforcing their money judgments by the same manner of execution as is available for common law judgments. On the other hand, the contempt process is no longer generally applicable to money decrees.

From an early day legal systems have been obliged to contend with the fraudulent acts of a debtor committed in the endeavor to place his property beyond the reach of his creditor. Here the Roman law provided the *actio pauliana* for the purpose of setting aside any fraudulent alienation on the part of the debtor. When the particular acts against which this action was directed are considered (Roby, H. J., *Roman Private Law in the Times of Cicero and the Antonines*, 2 vols., Cambridge, Eng. 1902, vol. ii, p. 274), it may be concluded that in point of dishonest ingenuity the fraudulent debtor of that era was not far behind his successor of today. The devices resorted to by the latter are of the most varied character. Most elementary is the conveyance of property to a relative or friend in anticipation of the judgment; common also is the collusive judgment intended to protect the debtor's estate from the judgment of a bona fide creditor. The corner stone of the Anglo-American law in the present regard is the English Statute of Fraudulent Conveyances (13 Eliz., c. 5) dating from 1571, which declared void all alienations made with intent to hinder, delay or defraud creditors. This statute has been hardly more than rewritten by the Law of Property Act [15 Geo. v, c. 20 (1925)]. The matter of fraudulent conveyances also finds regulation in various modern American statutes, notably the Uniform Fraudulent Conveyance Act, which has been enacted in some fifteen states of the union. While the defrauded creditor is not with-

out remedy through common law processes, especially as aided by statute, the equitable jurisdiction of the courts is of superior effectiveness for his relief. Accordingly the work of undoing such fraudulent transactions largely falls to that jurisdiction. Originally the case here presented was for the most part one of equitable execution, for invocation of the equitable aid presupposed the recovery of judgment by the creditor and the return of ordinary execution unsatisfied or at least his recovery of judgment. This is still the rule, subject to some exceptions, in perhaps the majority of the American jurisdictions. Elsewhere, however, and particularly under the Uniform Fraudulent Conveyance Act the rule has given way; and as a result the aid in question may be invoked in advance of the judicial ascertainment of the creditor's claim. In case of the debtor's bankruptcy the right to attack the fraudulent alienation passes to the trustee in bankruptcy.

A characteristic feature of American legislation is the emphasis which it places upon the designation of a greater or less quantum of property as exempt from execution. At common law out of the property available to the creditor nothing but a minimum amount of wearing apparel could be retained by the debtor. And in the English law of today his exemption extends only to bedding, wearing apparel and tools of trade not exceeding £5 in value. A very different attitude appears in the United States. The personal property exemption is universally of a more generous character; sometimes it is of striking dimensions. Even more significant is the American policy of liberal homestead exemption laws which has been influential in many parts of the world.

In their progression from the original ruthless treatment accorded the defaulting debtor legal systems have come fully to satisfy the dictates of humanity. But in the United States recognition of the larger social interest involved has carried it far beyond this point to a distance which of necessity varies as the particularistic play of economic and social forces gives the creditor or the debtor influence the higher measure of political ascendancy. By and large, however, the situation in the United States induces the doubt whether the creditor is receiving the protection to which he is entitled. There is general agreement that the way to judgment is too thickly beset with procedural obstacles. But after judgment is had, the way to realization is also an obstructed one. The ultraliberal exemp-

tions frequently encountered; the facility with which a knavish debtor may effect a concealment of his assets, to be overcome if at all only by toilsome effort on the part of the creditor; and, finally, the impassable barrier which may be erected by a bankruptcy law not oversolicitous on the creditor's behalf, all operate to hinder the creditor from reaching his goal.

A study of the civil courts in New York City made by the Institute of Law of Johns Hopkins University in 1931 discloses some startling facts in this regard. Its examination extended to 4279 of the 9365 judgments entered by the Supreme Court during 1930 and to all the judgments of the City Court entered during that year. From this examination it appears with respect to the pecuniary aggregates of these two classes of judgments that satisfaction was recorded only as to 6.72 percent in the one class and 7.17 percent in the other. While on account of the greater opportunities for subtraction of assets obtaining in a metropolitan community such as New York the percentage of realization is probably much lower than that prevailing in the country as a whole, these figures have a highly significant bearing on the general situation. They tend strongly to confirm the idea that American law in its present form is not maintaining the just balance of advantage as between debtor and creditor.

Finally, it is to be noted also that the modern mobility of capital increases the risks of the international evasion of judgments. With reference to the international recognition of judgments it is the modern English rule that a foreign judgment is in the main deemed conclusive, except as against the objection of lack of jurisdiction or of fraud. In the United States the doctrine of the federal Supreme Court is substantially the same, with the significant qualification that this degree of conclusiveness will attach only to the judgments of foreign countries which accord American judgments reciprocal treatment. This qualification, however, does not find unanimous acceptance by the state courts. Despite the conclusiveness thus recognized there is no merger in the case of the foreign judgment; in other words, the plaintiff is left free to sue on the original cause of action if he chooses. Moreover under Anglo-American law the foreign judgment itself is not a basis of execution; it serves only as a basis for an action, and it is by virtue of a favorable judgment in this domestic action that execution is had. The rule is commonly otherwise under continental law: the

judicial proceeding required being one to obtain permission (*exequatur*) to enforce the foreign judgment. But in foreign countries varying rules obtain on the question of conclusiveness; some grant no recognition at all except as this is determined by treaty, a fact which under existing conditions prevents the recognition of American judgments. Most others require reciprocity—another serious obstacle. Italy was formerly notable for its liberality in recognizing foreign judgments. But the attitude of other European countries has led to a stricter policy on its part. The greatest progress in securing the enforcement of foreign judgments by treaty has been made on the continent of South America.

Interstate recognition of judgments stands on a different basis. In the United States it is governed by the full faith and credit clause of the federal constitution. In the case of the sister state judgment, unlike that of the foreign judgment, there is deemed to be a merger of the original cause of action. But no more than the foreign judgment is it *per se* executory; its enforcement requires the bringing of a new action. As between England, Scotland and northern Ireland the reciprocal enforcement of money judgment is accomplished as a result of simple registration. The same thing is true as between the states of the Commonwealth of Australia under a constitutional provision which closely follows the American full faith and credit clause. A similar method of registration but with provision for notice to the judgment debtor before actual execution governs as between Great Britain and the principal British dependencies. The future therefore may see the present American system of interstate enforcement by action give way to some simpler method, which without cutting off the opportunity for defense within the limited scope allowed by law will open to the creditor a speedier road to realization.

JUDICIAL INTERROGATION, or the questioning of witnesses by the judge for the purpose of investigating the evidence in a particular case, is characteristic of continental as opposed to Anglo-American procedure. In the civil procedure of both systems investigation by the judge is relatively unimportant, since evidence is presented largely by the parties to the suit in accordance with the concept that the civil case involves the rights of the litigants rather than those of the state. This theory has developed historically in the territories influenced by Roman and Germanic law and is accepted with certain qualifications in continental and common law countries. On the continent documentary evidence predominates; when it is supplemented by oral testimony, whether taken before or during the trial, it is the judge who questions the witnesses. In England and even more in the United States this task devolves upon the attorneys, although the judge occasionally interposes questions. But in both types of civil procedure the judge plays a minor role in establishing the evidence.

In criminal procedure in the Anglo-American courts the situation remains the same. A trial is a contest between the accuser and accused in which the evidence is presented, as it was in the classical Roman law, through direct and cross examination of witnesses by the parties or their counsel. In England, although the examination is for the most part conducted by the attorneys, the judge still retains something of the character of the examiner and often questions the witness, but in the United States he has become virtually an umpire, merely restraining the attorneys from violating the rules of evidence. On the continent, however, the judge in criminal cases is an inquisitor, whose duty is not to rely on the prosecution and defense counsel but to investigate the facts of the case for himself. This concept was derived from canonical practise which, although it had originally followed the accusatory theory of the Roman and Germanic law, had by the fourteenth century definitely recognized an inquisitorial process. In this process the judge investigated the case against the suspect, interrogated witnesses and carried on the prosecution. The features of inquisitorial procedure were adopted by

the secular courts. Numerous changes were effected, particularly through the codes, and although the judge is now a supposedly impartial director of criminal proceedings he still maintains his exalted position in trial procedure, particularly in the interrogation of witnesses.

The continental system is best epitomized in the French courts. For major criminal offenses there are jury trials in the *Cour d'assises*, where the president first interrogates the accused, then permits the witnesses to tell their story and questions them on particular points. The indictment has been preceded by an investigation carried on by a *juge d'instruction*, who has examined the accused and the witnesses; the record of this examination is before the president at the trial as a partial basis for his interrogatories. The prosecutor and defense counsel may question the witnesses through the court but in practise they pose very few questions and the admission of these is entirely at the discretion of the court. The judges, however, rarely deny this privilege. In the course of the trial counsel may attempt also to rebut the statements of witnesses. After the taking of testimony the attorneys sum up, the defense having the last word. A similar procedure is followed in general in the correctional courts, where, however, there is more reliance on the record of the investigation before trial.

In the Anglo-American courts the attorneys examine their own witnesses, the testimony consisting almost entirely of answers to specific questions. After the direct examination of a witness there follows the cross examination by the opposing counsel, who attempts to break down the testimony or to change its emphasis. The judge's task is mainly to prevent improper questions and to present the case to the jury.

The supporters of the Anglo-American system contend that it is only by direct examination and by the cross examination, which attempts completely to discredit the witness, that the truth of his testimony can be gauged. On the other hand, the continental system is extolled as one in which the evidence does not depend upon a battle of wits but upon the interrogatories of a trained non-partisan judge and in which the verdict is based upon a more honest presentation of the facts. Both points of view, however, mistake the logical system for the actual process and fail to compare the ultimate results. In practise the idealized Anglo-American direct and cross examination is not a method by which counsel attempts to establish the complete truth

but rather a legal duel in which each attorney tries to distort the testimony to his own advantage. Favorable evidence is easily established by confining the witness to particular questions and is just as easily discredited by a cross examination which emphasizes only certain aspects of the situation and limits the witnesses to mere affirmations or denials. Further direct and cross examination may finally elicit the entire tale but the version is unbalanced and frequently appears, even in the case of honest witnesses, confused and questionable.

In the continental jury trial the president of the court encourages the witness to tell his complete story and then brings out certain points by his questions. While the interrogation of witnesses is usually gentle, in the case of the accused the president often evinces official prejudice and his sarcastic, insistent questioning approximates that of a cross examining attorney. Even in examining witnesses his unconscious prejudices prevent an entirely objective presentation of the testimony. This danger is recognized and in France since 1881 the president has not been permitted to sum up the evidence. The questions suggested by the attorneys may offset the danger of judicial bias but they usually play only a minor part in the trial. The interrogation of witnesses cannot, however, be regarded as an isolated phenomenon. It is only an element in trial procedure, and other factors enter into the verdict in jury trials. If the clever lawyer rather than the just cause frequently wins in England and the United States, he triumphs as often on the continent. The actual evidence, whether established by judge or attorneys, must always be weighed against the final speeches of counsel. The eloquent one-sided interpretation of the testimony and the play upon the emotions of jurors are effective wherever the performance takes place.

In non-jury criminal trials, as in the French correctional courts, the system of judicial interrogation has its obvious advantages. The president of the court is a trained investigator, examiner and judge, theoretically free from prejudice and partisanship. His examination is directed to those points on which he desires further information and no time is wasted in legal battle or in attempts to obscure the issues.

JUDICIAL PROCESS is the name given to the intellectual procedure by which judges decide cases. It comprehends all the ways of mind, deliberate and subconscious, and all the elements in personality, profession and environment which impel toward judgment. Our knowledge of it is limited and colored by the available materials, which are principally "opinions" in which appellate courts explain their decisions. In contrast with philosophy, in which an abstract argument is driven uncompromisingly forward, and with narration, in which a series of events is objectively recited, the concern of the judicial process is with the general as it relates to the particular. Its position is along the front where legal principles find their application; as case follows case in endless succession, the cause and the law are alike upon trial. In the instance the suits are controlled by the rules; in the aggregate the rules are determined by the suits. In a course of judicial events the abstractions-in-the-books and the tangles-out-of-life are remaking each other.

The character of the judicial process is determined by the institution of litigation. It is a way of inquiry set within arrangements for orderly legal combat. The state indicts a jobless worker for stealing bread, a man sues his neighbor because of unkind words, a buyer attempts to retreat from a bad bargain or some other bit of human behavior or misbehavior raises a justiciable question, and an intricate legal conflict is touched off. In the mechanics of trial the witnesses armed with oaths, the attorneys tilting

with verbal and inquisitorial thrusts, the judge applying the rules to the game and the jury returning "the verdict in accordance with the evidence" all attest a combat by law. An elaborate code decrees that a case must present "a cause of action," go before a court which has jurisdiction and move forward by decorous stages; it allows an appeal to a higher tribunal because of "error" in the conduct of the litigation; and it reflects the solemnity with which a serious matter is to be dispatched. As the administration of justice has developed ritual has given way to deliberation, the rigidities of procedure have been softened and the office of judge has shifted from umpire toward inquisitor. But the cluster of judicial usages, in a highly selective manner, still hems in by ceremonial observance "the consideration of the suit upon its merits." In the struggle every convention is a potential obstacle against which the cause may break down; the resourceful attorney may even employ the devices of due process to wear out his opponent's case. At every step, from complaint and answer to definitive judgment, questions may arise which must be presented to a higher court. In the extended process the successive judgments upon procedure determine the issues of substantive law which demand decision. A comparison of the intricate record of a case-in-the-making with the trim lines of the judgment into which it is crystallized reveals the task of turning litigious struggle to the uses of inquiry.

The point toward which the judicial process converges is the disposition of the case. It is the necessity for decision which winnows out the relevant evidence and significant issues and drives the elaborate process of analysis and deliberation to its result. Its definite objective makes the ways of mind of the bench highly selective and very purposive. The act of judgment, stripped of irrelevance and complications, is simple; it is an approval or disapproval of acts of conduct by reference to legal standards. In an elementary case where the facts are beyond dispute, where the act falls into a definite category and where the legal consequences are certain the process of decision follows the easy groove of the syllogism. But as causes crowded with the stuff of life come into the courts, the primary terms of "the law" and "the facts" are found to comprehend intricate and disputed permutations of rules and circumstance. A conflict in testimony, the disputed motives behind behavior, the dubious classification of conduct or the uncertainty

in meaning of the law may broaden the range of judicial attention. A number of issues which differ in kind may have to be cleared up before a perspective is found; the lesser questions may have to be settled as best they can by the weight of evidence, the greater authority or preference for a value or a principle. The key to a complicated suit may be found to lie in some minor issue which for a time eludes search. A judge, finding himself without formal guidance, may be compelled to follow an intuitive reaction or to make an arbitrary choice. The court may have to resort to tricks of the trade to get ahead with its work: "judicial notice" enables relevant information to be used which it would be tedious or impossible to bring in as testimony; "presumption" may force the party against whom it is made to present in rebuttal evidence otherwise inaccessible. It is often convenient and sometimes quite necessary to employ "fictions" to help the argument over a hard place, to round out the picture of the dispute or to serve as a short cut to a proper result. The assumption that the act of the agent is the act of the principal allows damages to be collected by injured persons who might otherwise possess nothing better than valid but worthless judgments; the make believe that the corporation is a person—conveniently forgotten when the fiction does not work—enables a code governing individual conduct gradually to be adapted to the exigencies of an impersonal business unit. The varied tasks and inquiries into which an act of judgment is resolved demand quite different intellectual procedures. Even if the syllogism furnishes the skeleton of the argument and the major and minor premises are poles to which all the processes of mind move, the patterns taken by judicial inquiry present a rich and colorful variety.

In the judicial process the general and the particular inquiries are aspects of an organic whole. The quest is not for "the law" and "the facts" but for the law relevant to the ascertained facts. The legal standard may be found in the lines of the constitution, the provisions of a statute or the precedents of the court. But the written law consists of the lean lines of abstract documents which lack the faculty of self-interpretation. They are phrased as general commands and prohibitions, cover incompletely the subjects to which they relate, fail specifically to provide for all the permutations in conduct which come along and do not anticipate the innovations in circumstance and behavior which social change

brings. Their application to suits at law, filled with the richness, color and pulsing life of humanity, must depend upon the concrete meaning which judges discover in their catholic propositions. In the construction of statutes "the plain and literal meaning of the words," the purpose which animates the acts or "the manifest intent" of their drafters with reference to the novelty before the court may be followed. The interpretation must depend upon the importance of the cause, the interests which are at stake and where the sense of the judge makes justice lie. A jurist refers to "the necessity of having to assimilate into the law the occasional obtrusions of the legislature." In a continuing judicial process the constitution and the statutes may offer guidance and impose limits; but it is only as the decrees of the legislature are converted into detailed statements relevant to the affairs of everyday life that they become part of the living law.

Accordingly the quest for legal standards runs into the domain of case law. The applicable principle must be discovered in former decisions or distilled from the run of cases in the reports. If the precedents are in point and unconfused, the mental journey is easy; if they relate merely to similar things or hail from a different age or reveal a conflict of authority, the act of judgment cannot escape discretion. In such instances the discovery of the law involves all the critical awareness which the judge can bring to the task. The substantive issues must be disentangled from impinging questions of procedure, holdings stripped from the enveloping dicta, and the relevancy of past utterance to the bundle of particulars which is the instant case carefully determined. When the comparison reveals more of likeness than of identity, the binding force of the precedent is a matter of imputation. But even when the going is difficult and "therefore's" are most dubiously set down, the process is not blind. The worth of bygone decisions lies as often in the experience which they hold in the mass as in the rules of law they specifically embody. The values at stake may unconsciously impel judges to a choice between rival precedents. The most penetrating of jurists will not ignore an unbroken line of cases which relate to the issue before him; the most literal minded servant of "the law" cannot be completely oblivious to the difference it makes that the decision goes one way or the other. A noted jurist has said that "logic is not to be ignored when experience is silent"; and the line, "the life of law is not logic but experience," has become

classic. At its tightest logic is the dominant element in the judicial process; at its loosest the necessary resort to analogy may become naïve and unreal. In case law the principle must of necessity be sought out among the precedents, but the way of search has no simple chart.

In their quest of "the law applicable to the case" jurists have developed their own technology. Every tool in "the legal smithy" has its use and its hazard; the quality of the product depends upon the skill of the judicial workman. The web of the law is woven with words, yet verbal symbols never carry meaning with precision. When a case is decided, it is not enough to set down the specific holding; the behavior in question must be appraised with reference to a universal standard. When a later cause comes along, the overgeneral words may be found to comprehend particulars they were never meant to include. Inasmuch as words do not cover tidy little squares but each possesses its own conglomerate domain, it is easy to slip from one meaning to another; a proposition set down to broaden the law may, by so slight a change as the unconscious interpolation of the word "only," be used to narrow it. The resort to analogy has its own peculiar pitfalls: a general term must frequently be chosen as a logical nexus between precedent and instant case; the category may be only one of a number which comprehend the two particulars and its inconsiderate selection may contain an undistributed middle. Thus the concept "brokerage" has been carelessly used to apply to employment agencies a rule of law contrived for the merchandising of theater tickets. The word "wousin" has been invented as a name for a thing which appears to be an autonomous entity but is a permutation of particulars which may be put together in innumerable ways. Verbal currency passes most uncertainly from country to country and between the generations. As a result precedents may be made to compel where they were never intended to apply; but "ignorance is a great law reformer," and judges often assume that their predecessors were men of sense and reason such as themselves and endow with current meaning the rules by which they are bound. In an organized combat the art of logomachy is not to be escaped, and judges must be wary of attorneys who take advantage of the undefined frontiers between conceptual provinces to give to abstract words a little push in the right direction. In probing into the utterances of others and in writing down his own decisions the judge who knows his craft proceeds warily; he

regards words as the necessary instruments of judgment and communication rather than as fixed categories which automatically claim their instances.

Nor are "the rules of law," with which jurists ply their trade, automata which strip from judgment its choice. They are often mere formulae-for-decision, providing terms which are receptacles for facts and within which the conflict of values may be resolved. The appraisal of carelessness in conduct by the standard of "the reasonable man" permits a consideration of the circumstances and compels judges to use their common sense. The principle which bases liability upon personal fault allows protection to be extended by a broadening of the latter concept. In the flexible propositions by which human behavior is legally appraised the nouns and the verbs may pronounce a doom from which the adjectives and adverbs grant a chance of escape. An intent may have to be added to an act to constitute a tort or a crime; unless the deed was "wilfully and wantonly" or "negligently" done the perpetrator avoids the penalty. The prefix "quasi" and the adjectives "implied" and "constructive" are habitually employed to extend the law of property or contract or warranty or what not into the borderland. A rule which distinguishes between the essence of an act and its incidence may invite the judge to an expression of his own preference: the acts of workmen on strike are often pronounced innocent or criminal as they are adjudged to be prompted by the worthy desire of "benefit to themselves" or the unworthy motive of "harm to others." In cases involving acts of negligence, terms of contract and equities in property, tradition demands that the specific events out of which litigation has emerged shall be passed in review. A realization that the issue between "the taking of property" and "the exercise of the police power" depends upon the measures at work has made of the Fifth and the Fourteenth amendments formulae of constitutionality; it has led to the appearance of "the factual brief" and to a consideration of social legislation upon its merits. As case follows case and the points along a line are gradually pricked out, a richness of meaning is given to the principles. But with human conduct in a changing culture as their domain rules of law can never be made to displace practical judgment.

In the judicial workshop even so necessary a device as *stare decisis* has only a limited use. As cases grow in number and variety they become a storehouse of knowledge and understanding,

representing the cumulative experience of the bench in resolving the tangles in human affairs. For the ordinary cases with which the court monotonously busies itself the precedents in point are sufficient for judgment. But as the novelty in emerging social life gradually creeps into litigation, their use has its dangers. A term may abide after its meaning has departed and the unfamiliar may appear behind the mask of the familiar. "Every judgment has its generative power" and tends to beget unlike things in its professed image; its "directive force for future cases" may carry it further than the reasons which brought it into existence would allow. It is on occasion essential, if the law is to be kept living, to use rather than merely follow precedents; but every revision of the domain of a principle and every addition in meaning to a concept involves an act of discretion. Even cases which appear alike may have essential differences, and the technique of distinction is born of judicial experience as a check upon the uncritical use of precedents. The insistence by a court upon *stare decisis* when the former decision turns out to have been erroneous is a vestige from days of universals and absolutes. It is likely to bring confusion and delay even when applied to a statute, where the judicial mistake may be rectified by the legislature; it is likely to perpetuate an error and even block social experimentation when employed in constitutional law, where the judiciary has the last word. In the latter domain a ruling is now and then frankly overruled. More often the innovation is hidden behind a formal distinction and ingenious rhetoric permits the court alike to defer to a former judgment and to serve the current occasion.

As bench succeeds bench and suits are endlessly turned into judgments, the law grows. The flexibility in judicial technique permits the appearance of elements of novelty; the formal appearance of rigidity masks the fact of change from the eyes of the uninitiated. In the everyday case, where a definite rule is applied to known facts, the law is made rather than in the making. But even here if the principle be followed back through the precedents, its source will be discovered in a conscious choice. It has, like all the rules which the reports contain, been compounded out of prevailing ideas, common sense, conventional standards of right and wrong and the kindred stuff of folk thought. In fact the creative, as against the mechanical, task of the jurist is to domesticate to legal use the sanctions and tabus imposed upon conduct by social usage.

In an early case involving industrial accident a British judge argued that the servant knew the perils of the trade and the careless habits of other employees better than did the master and denied recovery. An American jurist shortly afterwards chiseled the common sense of English squirarchy into the clean cut "fellow servant" and "assumption of risk" doctrines. These were in time abstracted from the regime of handicraft, set down as universal propositions and applied to conditions of machine industry which could never have been in the contemplation of their authors. The very process of abstraction conceals the origin of a rule in prevailing sense and custom and gives it a dominion far wider than it could win by an appeal to contemporary reason. It passes from concrete holding to abstract precedent, to rule of law; it may require the startling challenge of manifest injustice to secure its reconsideration.

As with the origin so it is with the development of a doctrine. As a series of cases reflects changing conditions, the law responds certainly, even if slowly and stubbornly, to newer juristic necessity. The change may be logical or adventitious, systematic or disorderly. On occasion a court may announce a new principle, or the legal sport may be concealed by dwelling upon the novelty of the facts in a "case of first instance." More often a gradual departure is made from an outworn doctrine: on the surface the rule seems to acquire detailed meaning through a process of deduction; beneath it makes its truce with emerging circumstance and sense of right. The devices and procedures deliberately or intuitively employed by judges are sufficient for the legal emergency. The law has never allowed justice to be completely subordinated to legalism; it has always professed to save the unusual cause. It can, when need commands, set down an "exception"; but each exception is an invitation to another and a multiplication of instances will transmute an imperative into an elastic formula. A shift in juristic values may even elevate the exception into the position of the rule. The principle of "no liability without fault" first appeared as a device to save unusual causes from the older doctrine which held a man to "absolute" responsibility for his acts; the reverse trend toward "strict liability" represents the accommodation of the law of torts to an impersonal society. In the era of handicraft when its maker sold an article to its user the formula of "privity of contract" was an adequate expression of the rights of the parties. When middlemen were

interposed between producer and consumer it became irrelevant: the intermediary had a technically valid "cause of action" but no complaint; the user had a complaint but no cause of action. The problem of recovering the older protection is being solved by the resort by various courts to such different concepts as negligence, fraud and implied warranty. Principles may be converted into open propositions or even nullified by the invention of counterrules. Even before statutes upon the subject appeared, the employer's defenses of "fellow servant," "assumption of risk" and "contributory negligence" were being matched by rules which made even subofficials "vice principals," required the master to provide "a safe working place" and imposed upon him the "non-deligable duty" of instruction.

In a sequence of cases the difference between holding and holding may be small, yet the judgments at the beginning and the end may lie far apart; thus the law grows through illogical increments too small to be detected in the instance yet clearly evident in perspective. The weight of precedent, the fortuitous appearance of cases, the bondage of judicial technique to litigation, the unordered and almost leaderless army of judges, arrest and confuse the work of restatement. A cross section displays only a clash of values and a confusion in holdings; a genetic account is required to reveal the older moorings, the trends manifest but not realized and the direction of development. In its longer sweep the appearance of the judicial process belies reality; behind an affectation that the law is static, complete and abiding the judge performs his social office of squaring the necessity which time and change bring with the established law of the land.

Yet the jurist discounts or even disclaims his creative work. Although the great corpus of the law is the handiwork of the judiciary, the emerging decisions are set down as mere applications of preexisting rules. The rhetorical usage reflects a substantial truth, for the continuing bench rather than the individual judge is the dominant agent in the process. The original touch in the single judgment—the shading of a word, a choice between two rules, the giving of a little neater fit to a precedent, an implication of meaning not evident until afterwards—may demand careful search. Even when a significant decision "makes judicial history" it is "not the judge who speaks, but the law which speaks through him." This stage play is almost a necessity; jurists, whose occupation holds far more

than its proper share of thankless tasks and dirty work, are more comfortable in having authorities with which to support their decisions, and the prestige of courts is strengthened by a recourse to "the law" with which "to beautify what may be disagreeable to the sufferers." The world of absolutes and fixed categories and the mechanistic conception of the universe still linger in common sense; their counterpart in Aristotelian logic continues to dominate the forms of judicial expression. It has required the notion of growth, a skeptical attitude toward universals and the discipline of the case method to bring an experimental attitude into law. The idea of judgment as "hypothesis" is gaining at the expense of "eternal verity"; but even today the recognition of trial and error is partial. Compromises between authority and necessity result from the successive formulations of the law. As conditions and opinion become stable, the law tends toward organic unity; at the impact of an advancing culture it becomes disorderly. In a society which is ever emerging relevancy must be bought at the expense of certainty; a tolerable compromise between desirable values is all that can be expected. An experimental character can be given to a legal code only by jurists; their work lies along the front where the wisdom of the past is applied to current life and is remade by it. It is useless to inquire whether judges should or should not make law; the fact and the necessity are alike inescapable. The goodness or badness of judicial lawmaking lies in the skill with which members of the bench ply their trade.

As the judicial process runs ceaselessly on it leaves a distinctive record. A usage prevalent among appeal courts requires the way of decision to be resumed in a written statement. It is impossible to say just when "the opinion" came into vogue; its analogue is to be found in Thomas Aquinas, in the Justinian code, in the earliest scraps of legal writing; in the common law its germ is to be found in Bracton and the *Year Books*. In days when judges were wise but not necessarily literate reasons orally recited were passed on by the treacherous memory of scribes; a jurist fearing for his repute complained that "the reporters will make us out to posterity for a passel of fools." As case law developed, the resort to writing became a guaranty of the authenticity of holdings. The dignity of the jurist's office entitles him to his speech; in England when judges sit en bloc the brethren usually express themselves seriatim; in America the modified usage of "the opinion of the court" generally pre-

vails. It is idle to seek the ultimate "why" of so essential an instrument; in the administration of justice it serves the multiple purpose of helping the bench to be critical of its own intellectual processes, keeping lower courts in order, announcing legal standards for acceptable human conduct, extending the courtesy of an answer to arguments which do not prevail and affording an opportunity to justify a judgment. The opinion is indispensable to case law, has made an institution of the judicial process and gives continuity to the development of legal doctrines.

The usage of dissent is an expression of the independence of the judiciary. It has long seemed unwise to leave important causes to the judgment of a single individual; to insure due deliberation and wise decision they are referred to a bench of judges. To each, as of right, independent judgment has been accorded and in case of division the majority prevails. The dissenting opinion was not deliberately contrived; it is a by-product of this arrangement. After a case is heard the members of the court may fail to agree in reasons or upon the result. A period of deliberation may reduce these differences but in spite of all effort there may not be a meeting of minds. The spokesmen for the court and for the minority then prepare and exchange tentative drafts of their opinions, and frequently each document is rewritten to take account of the argument of the other. Many jurists regard the public expression of dissent as a duty, and few members of the bench question the value of the usage. A knowledge that each judge is free to inquire, to act and to speak for himself helps to assure lawyer, litigant and the public that all relevant facts and issues will be considered. As a result the bench does its work under constant self-criticism. The spokesman for the court is forced to choose his positions with care, to draw his conceptual lines sharply and to keep his holdings from becoming overabstract. The law which comes to prevail is a far more serviceable agency of social control because of the cumulative effect of challenge. The solitary judge is most likely to sense the need for legal restatement; the path of constitutional law has often been blazed in dissent. There is little evidence that the independent expression of views by individual members weakens the authority of the court. The majority opinion and the dissent are set down side by side in the record, where they can be read, studied and compared. If truth has in itself the capacity to prevail, the law reports accord it an opportunity.

The law reports, crowded with opinions, are

the treasure house of the jurist's art. The technique of judgment is of its own kind. Unlike the poet, the historian or the essayist the judge cannot listen to the promptings of his own heart, choose the subject upon which he would write, say in his own manner all that is on his mind and follow his interest to a fresh theme. In saying his say the place of the jurist is in the institution of the judiciary; he cannot escape its usages, must employ its language and tools and is bound by its limitations. He is a member of a court and his studied utterances are an incident in the disposition of litigation. He cannot speak until the appropriate cause comes along; he can say only so much as the issues allow; he must wait for a suitable opportunity to continue. Even when he is interpreting the constitution he addresses himself not directly to public policy but to the questions of law into which it has been transmuted. In justice as in every craft the artist leaves his distinctive mark upon his work. Even when rules compel and one cause is much like another, the manner of the judge appears in the interstices of opinion. In cases of consequence he leaves the indelible stamp of his personality upon his paragraphs. His manner of utterance differs as he is announcing a judgment or recording a dissent. When he is the voice of the court his is usually a compromised statement, often marked by "the veiled phrase, the blurred edge, the uncertain line." It represents not what any member would like to say but what all who concur are willing to accept. In the dissent, on the contrary, the jurist expresses his unfettered opinion. The cause has been lost, further deliberation would only delay judgment; "his voice is pitched to a key that will carry through the years." He may elect to include a particular within a concept, to extend a developing doctrine another step, to round out the law by borrowing customs of the people, to remake rules to serve a current justice or to combine elements into a distinctive method; but in the practise of his trade he cannot escape being himself. He must recognize both legal rule and social value; and where they inevitably clash he must effect the best reconciliation that may be between them. The judge must become the statesman without ceasing to be the lawyer. The quality of his work lies in the skill, intelligence and sincerity with which he manages to serve two masters.

It is impossible to contrive a formula for so delicate and evasive an art. The procedure differs from case to case; the manner of work varies from judge to judge. It is not the cause but what jurists

discover in the cause—a mere dispute between individuals, a standard of conduct for an activity, the domain of a legal principle, the definition of a public policy—which holds the key to decision. The majestic arguments of judges may be directed to inconsequential suits; the battles of abstractions are always dramatized in a concrete struggle between human beings. The factors which impel the mind toward judgment present no standard combination. The jurist is a craftsman in the law; he is learned in its lore, responsive to its values, habituated to its discipline; constitution, statute and precedent must be compulsions toward decision. But even within legal formulations the objectives to be served may clash with the rules in which they find immediate expression. And since judges are men as well as lawyers, no line can separate professional from general equipment. The law itself is but an aspect of the world that lies within the jurist's head; the judicial process but the biting edge of a way of mind which stands but a little exposed. Out of the depths of personality "forces" which jurists "do not recognize and cannot name"—"traditional beliefs, acquired convictions, an outlook on life, a conception of social end"—keep "tugging at them." It is impossible for the judge to escape his own universe of fact, preference and conviction; the intangibles in their own subtle way will usurp a role in the argument. The more novel the issue or the larger the interests at stake, the greater will be the influence of common sense, of the climate of opinion, of the "stream of tendency" which "gives coherence and direction to thought and action." Jurists differ in sensitiveness to pleas, facts, legal law and social policy; they respond variously to the conflicting values which a suit presents—the rightness of the cause of a party, a principle which should prevail in spite of the injustice in the instant case, the need to extend law and order into a turbulent domain, the limitations of the judiciary as an agency of control. The interest and the adventure lie in the parts played in the drama. It is not the impulses-to-judgment but the after-thought-of-rationalization which takes its way through the reports. Here as in other domains of life the emotions play behind the scenes and leave the show to reason.

There is in fact something universal about the judicial process. It seems to be unique, because courts keep records which are read and criticized. If business men, university faculties, baseball players or débutantes were forced to set down

the good reasons for the decisions which make up their streams of conduct, the result would be a crude miniature of the judicial process. In law the rationalization of judgment has become a convention; about it customs, traditions, ways of thought, modes of expression, have crystallized into a cluster of flexible usages. It represents in a highly artificial form the act of personal judgment; it differs from the ordinary decision of everyman about an everyday matter as a critical intellectual process differs from a half intuitive experience. If the ways of jurists seem unusually prone to inconsistency and error, it is because the way of abstraction is made hard by unanticipated causes. If the categories of statistics or the methods of philosophy or the principles of economics were continually tested by cases fresh from life, the outward integrity of these disciplines would be seriously disturbed. At present we know little more of the craft of judgment than can be gleaned from the words and between the lines of the reports. An increase in understanding must await materials concerned with and a psychology relevant to deliberation in process. But at this point the quest of the "how and why judges decide cases" runs into the larger search for the ways of mind.

JUDICIAL REVIEW is the power of courts to pass upon the constitutionality of legislative acts which fall within their normal jurisdiction to enforce and the power to refuse to enforce such as they find to be unconstitutional and hence void. Together with its juristic product, a body of "constitutional law," judicial review is today the most distinctive feature of the American constitutional system; for while it has been imitated to some extent in other constitutions, its foreign variants have nowhere attained anything approaching the importance of the original. Three branches of judicial review should be distinguished: first, the power of all courts to pass upon the validity of acts of Congress under the United States constitution—"national" judicial review; second, the power and duty of all courts to prefer "the supreme law of the land" as defined in article VI of the constitution over all conflicting state constitutional provisions and statutes—"federal" judicial review; third, the power of state courts to pass upon the validity of acts of the state legislatures under the respective state constitutions—"state" judicial review. The most important consideration for public law is the ultimate role of the Supreme Court of the United States in the first two closely related fields. In this article the emphasis will be upon the judicial review of legislative acts. The growth of administrative bureaus and commissions has raised the problem of the judicial review of administrative acts and decisions, but in so far as this raises unique questions it will be found discussed under ADMINISTRATIVE LAW; COURTS, ADMINISTRATIVE; CERTIORARI; MANDAMUS; STATE LIABILITY.

By the official theory [*Federalist*, no. 78; Chief Justice Marshall in *Marbury v. Madison*, 5 U. S. 137 (1803); *Adkins v. Children's Hospital*, 261 U. S. 525, 544 (1923)] judicial review is not a specifically delegated power, although there are phrases of the constitution which clearly con-

template its existence; rather it is the inevitable outcome of the power of the courts in deciding cases to interpret the law, of which the constitution is part. More explicitly the doctrine of judicial review comprises the following propositions: that the constitution is law in the strict sense of a body of rules known to and enforceable by courts; that it is law of higher obligation than any legislative act which purports to have been made under its sanction; that consequently the court must in case of conflict between the constitution and a legislative act determine the rights of parties in accordance with the former; that by the principle of the separation of powers a judicial interpretation of the standing law and so of the constitution is final for the determination of the case in which it was rendered.

The criticism to be made of this theory is that while it accounts sufficiently for the power of the court to decide cases by rules drawn directly from the constitution, it does not account for the fact that such rules are generally regarded as binding the legislature in the shaping of future legislation. To explain this, the essential feature of judicial review, one must fall back upon a somewhat mystical notion of the relation of judges to law. Others may have opinions of what the law is, but judges are presumed to know the law. They are its mouthpiece and the law is not changed by their utterance of it. Thus judicial review conserves the constitution; and the judicial version of it is the authentic constitution. Nevertheless, there have been those who have dissented from this view—among others Madison, Jefferson, Jackson and Lincoln. Thus Lincoln while admitting that the decision of the Supreme Court in the *Dred Scott* Case was final for that case denied that it established a rule which should control Congress henceforth. And the history of the period of the Civil War and reconstruction affords ample proof that there can be times when Congress will consider itself warranted in ignoring the judicial gloss upon the constitution and in acting upon its own independent reading of the basic document. Even today judicial review is perhaps not an altogether closed system.

The effort has been made, but unsuccessfully, to trace judicial review to colonial institutions. The colonial charters did, it is true, generally stipulate that the local legislative power as that of an inferior corporation must keep within the common law; and in the case of *Winthrop v. Lechemere* the Judicial Committee of the Privy Council disallowed in 1728 an act of the Con-

necticut assembly which abolished the rule of primogeniture in that colony on the ground of its transgression of this well recognized principle (Andrews, C. M., "The Influence of Colonial Conditions as Illustrated in the Connecticut Intestacy Law" in *Association of American Law Schools, Select Essays in Anglo-American Legal History*, 3 vols., Boston 1907-09, vol. i, p. 431-63). This alleged "precedent" for judicial review was, however, totally unknown to the authors of the American constitutional system, who far from regarding the first state legislatures as continuing the colonial assemblies held them to be "sovereign" lawmaking bodies after the model of the British Parliament.

Unquestionably the *fons et origo* of all talk and all thought about judicial review in the United States is to be found in Lord Coke's famous dictum pronounced in 1610 in Dr. Bonham's Case (8 Rep. 107, 118) that "the common law will controul acts of Parliament, and sometimes adjudge them to be utterly void" as "against common right and reason." One hundred and fifty years later James Otis invoked this dictum in his argument in the famous Writs of Assistance Case [Quincy's Mass. Rep. 469-85 (1761)], and from that time forward similar sentiments were frequently voiced by colonial advocates.

The early state constitutions did not, however, at the outset contemplate judicial review, having been framed under the influence of the Blackstonian doctrine of legislative sovereignty. This principle cut in two directions. In the first place, it asserted for the legislative body the predominant position in the constitution—indeed it virtually put all the powers of government at the disposal of the legislature. In the second place, it swept the boards clear of all categories of "law" except positive law. "Higher law," "law of nature," "law of God"—these might still be termed law by courtesy but the only true law was that which had the express or tacit sanction of the sovereign legislative body. In this situation for an ordinary court to undertake to "defeat the intent" of an act of the legislature was, as Blackstone pointed out, little short of revolution, and the success of such an attempt would spell the end of the constitution (1 Comm. 91).

How then did judicial review come finally to achieve a logical foothold in the state constitutions? The answer is to be found in the altered character which came gradually to be attributed to these instruments of government. At the outset they were regarded as a species of social

compact, the product of revolution and of the inalienable right of men to determine their political institutions. But presently, as the process of constitution making became regularized, they took on a new aspect, that of a higher form of statute emanating not from the sovereign legislature but from the sovereign people. Legislative sovereignty gave way to popular sovereignty.

The first suggestion of judicial review as a constitutional procedure did not, however, wait upon its rationalization, although that succeeded with reasonable promptitude; it was provoked by the gross abuse of their powers by many of the early state assemblies. In relation to "judicial power," "legislative power" was at this date undefined; and in the general absence of courts of Chancery it became a frequent practise in many of the states for the legislature to intervene in the proceedings of the ordinary courts, annulling or modifying their judgments, reopening private controversies and even determining them by "special acts." When values based on paper currency collapsed after the revolution, the majority of the legislatures fell under the control of the large farmer debtor class and began to pass laws for its relief. At the same time they showed themselves utterly careless of the treaty obligations of the Confederation, which of course was entirely dependent upon them for the effectuation of its exiguous "powers." For all these reasons the leaders of society gradually became convinced that means must be provided for curbing the state legislatures in the interest both of vested rights and of the maintenance of the union; and from this conviction resulted in due course the gubernatorial veto, judicial review and the constitution of 1787 itself.

The first case approximating judicial review in this country seems to have been the New Jersey case of *Holmes v. Walton* decided in 1780. Here the New Jersey Supreme Court refused to enforce an act of the legislature of the state by which certain criminal prosecutions were made triable by a jury of six on the ground that it transgressed the provision in the state constitution for "trial by jury." Although the decision met with considerable popular protest, the assembly soon modified the act so as to require the trial judge to grant a jury of twelve upon the demand of either party (Erdman, C. R., Jr., *The New Jersey Constitution of 1776*, Princeton 1929, p. 91-92). Four years later Alexander Hamilton, in arguing before the Municipal Court of New York City the case of *Rutgers v. Waddington*, assailed a recent act of

the legislature of that state as contrary to principles of the law of nations, the treaty of peace with Great Britain and the Articles of Confederation; and although the Municipal Court did not venture to pronounce the act "void," it accomplished the practical results of so doing by the construction which it put upon the act. The real importance of Hamilton's argument, however, lies in the fact that two years later it prompted John Jay, then secretary for foreign affairs, to suggest to Congress that it recommend to the several state legislatures the repeal of all acts contrary to the treaty of peace in general terms which would leave to the local judiciaries the decision of all cases arising under the treaty according to the intent thereof, "anything in the said acts . . . to the contrary notwithstanding." Congress so recommended in April, 1787, only a month before the meeting of the Philadelphia convention, which was soon to elaborate "the supremacy clause" of article VI of the constitution. Meantime in 1786 the Rhode Island Supreme Court had in the case of *Trevett v. Weeden* employed the subterfuge of "construction" to invalidate a paper money law of that state; and in May, 1787, the North Carolina Supreme Court in *Bayard v. Singleton* (1 Martin 42) pronounced "void," without evasion, an act of that state on the ground of its violation both of the state constitution and of the Articles of Confederation. Furthermore in counsel's argument in the former case as well as in Iredell's defense of the decision in the latter case as it appeared in the newspapers the main postulates of the doctrine of judicial review were developed along the very lines of Hamilton's later argument in the *Federalist* (no. 78) and of Marshall's opinion in *Marbury v. Madison*.

Despite these developments when the Federal Convention met judicial review was not as yet an established institution in a single state in the union. Indeed the mere suggestion of it had in most instances elicited condemnation which was fully as strong as its support, condemnation based for the most part on Blackstonian premises. Nor did the Virginia plan, which furnished the basis of the convention's early proceedings, evidence the least awareness of judicial review. By its provisions Congress was to prevent the states from violating the constitution, while Congress in turn was to be kept within bounds by a council of revision. Yet as debate on these proposals developed, judicial review as a logical and desirable alternative (along with the president's conditional veto power over acts of Con-

gress) was thrust forward more and more insistently, with what outcome is to be seen in the "supremacy" clause and the opening words of the second section of article III defining "the judicial power of the United States." By the former the state judiciaries are made the first line of defense of the constitution, of "the laws of the United States made in pursuance thereof" and of treaties of the United States against all conflicting state laws and constitutional provisions; while by the latter basis is laid for the appeal of all cases "arising under this Constitution" to the national judiciary and so ultimately to the Supreme Court. The latter phrase is moreover a textually adequate description of cases in which the question of the validity of congressional legislation is raised, although whether it was inserted with this understanding of it appears at least debatable.

What can be said with some confidence, on the basis of statements made in the convention, in the state ratifying conventions and in the *Federalist*, is that the leading members of the convention endorsed, at least at that period, the idea that the Supreme Court would have the power to pronounce "void" under the constitution an act of Congress no less than an act of a state legislature; and in the later numbers of the *Federalist* Hamilton discloses a rapidly expanding appreciation of the potentialities of this prerogative (cf. nos. 33, 78 and 81). The Judiciary Act of 1789, in the framing of which several of these same men had a hand, affords further evidence of like purpose, notably in the provision which it made in section 25 for final appeal to the Supreme Court of all decisions of state courts disallowing claims founded upon the constitution, acts of Congress or treaties of the United States. Finally, in 1795 we find the Supreme Court passing upon the constitutionality of the "carriage tax" of the previous year in a test case devised with the approval of Congress.

Judicial review became "constitutional law," indeed the corner stone of constitutional law in the American sense, in the decision by the Supreme Court in 1803 of the famous cause of *Marbury v. Madison*. *Marbury* was prosecuting a claim for an official commission under section 13 of the Judiciary Act of 1789, which in general terms authorized the Supreme Court to issue writs of mandamus to officers of the United States. The court in the person of Chief Justice Marshall interpreted this provision as attempting to vest it with "original jurisdiction" in a

type of case not enumerated in article III and so as void. This reading of section 13 in the light of later cases was erroneous and the view taken of the constitutional provision was at least questionable, although it had been earlier asserted (3 U. S. 321, 327) and has since been adhered to. The case in fact smells strongly of powder, for the battle between the chief justice and President Jefferson was already on. It is all the more striking therefore that the part of the court's opinion dealing with judicial review escaped Jeffersonian criticism, while other features of it certainly did not. Although the Supreme Court did not pronounce another act of Congress void until the Dred Scott Case fifty-four years later, between 1803 and 1857 it heard argument and passed upon the validity of a number of acts of Congress which it sustained [17 U. S. 316 (1819); 19 U. S. 264 (1821); 22 U. S. 1 (1824); 22 U. S. 738 (1824)]. Meantime the establishment of "state" judicial review was proceeding steadily; Rhode Island, which did not discard its colonial charter until 1842, was the last state to receive it. At no time, however, have the various state judiciaries been equally aggressive in pressing their pretensions. Prior to the Civil War more legislative acts succumbed to judicial review in New York alone than in all the remaining states of the union combined. "Federal" judicial review was finally put on a secure basis by Marshall's decision in 1821 in *Cohens v. Virginia* (19 U. S. 264), sustaining against an attack based on states' rights premises the constitutionality of section 25 of the Judiciary Act of 1789.

Dating from the earliest establishment of judicial review the courts have attempted the formulation of various restrictions upon the power. Some of these are corollary to the notion of judicial review as an outgrowth of ordinary judicial function, as, for instance, the rule that the power may be exercised only in connection with the decision of genuine, not "moot," cases. Others, on the contrary, represent a departure from the logic of the same concept and spring from a desire on the part of the courts to avoid collision with the political branches of the government, as, for example, the extremely vague rule that the courts will not decide "political questions"—whatever those may be. Another restriction is the rule, first stated by Chief Justice Marshall in 1834 (*Briscoe v. Commonwealth's Bank of Kentucky*, 33 U. S. 118, 122), that the Supreme Court would not "except in cases of absolute necessity" "deliver any judg-

ment in cases where constitutional questions are involved" in which a majority of the entire bench did not concur, although ordinary judicial functions are discharged by a majority of a quorum of the bench. Probably the maxim which is most frequently encountered as governing judicial review is the statement that all reasonable doubts on the constitutional issue must be resolved in favor of the legislature. Actually of course a considerable amount of doubt necessarily attaches to almost any question of law which is prosecuted by competent counsel as far as the United States Supreme Court; nor in fact are there many constitutional issues of moment in the determination of which the court is not required to exercise, in Justice Holmes' words, "the sovereign prerogative choice." Likewise little importance is to be ascribed today to the maxim that no legislative act may be judicially disallowed on the ground of its being opposed to "natural law," "natural rights" and the like—in short, on any other than strictly constitutional grounds. For while this maxim may have temporarily constricted judicial review, it certainly has not done so permanently. Today the most extremely latitudinarian results of extra-constitutional limitations on legislative power are freely available to all courts of the United States in the form of modern conceptions of "liberty" and "due process of law." Lastly, it may be mentioned that the Supreme Court in contrast with many of the state courts seems ordinarily to have discouraged taxpayers' suits as well as those in which the aggressive party has disclosed only the general interest of seeing the constitution observed.

In short, the scope of judicial review and consequently its importance as a governmental institution depend very little upon the rules which the courts have laid down from time to time in ostensible definition of it. Rather it is at any time a function of the entire structure of "constitutional law," which in turn reposes in the main, so far as the national constitution is concerned, upon the interpretations which the Supreme Court has come to affix to three or four brief phrases thereof. Regarded from this angle the history of the reviewing power of the Supreme Court has been as a whole one of pronounced aggrandizement, especially in the "federal" field, with the result that today the court enjoys a supervisory role which is quite without statable limits, particularly in relation to state legislative power.

First, however, attention should be drawn to

the exact opposite of the above mentioned development, since in four notable instances the court adopted views of the constitution which had as their considered purpose the minimization of its reviewing power: its decision in the early case of *Calder v. Bull* [3 U. S. 386 (1798)] confining the constitutional prohibition upon *ex post facto* laws to retroactive penal laws; its decision in *McCulloch v. Maryland* [17 U. S. 316 (1819)] broadly construing Congress' legislative discretion under the "necessary and proper" clause; its decision shortly after the Civil War in the *Slaughter House Cases* [83 U. S. Wall. 36 (1873)] rendering nugatory the "privileges and immunities" clause of the Fourteenth Amendment, because, as it recognized, the alternative construction would have rendered it henceforth "the perpetual censor" upon all state legislation; its decision in *Munn v. Illinois* [94 U. S. 113 (1877)], later reversed on this point, that the question of the "reasonableness" of charges set by a "business affected with a public interest" was one subject for final determination by legislative authority.

Of the holdings which have contributed to give the court's reviewing power its present dimensions in the "federal" field the following are outstanding: the interpretation under Marshall of the "obligation of contracts" clause as applying to public grants, including corporate charters [*Fletcher v. Peck*, 10 U. S. 87 (1810); *Dartmouth College v. Woodward*, 17 U. S. 518 (1819)]; the interpretation of the "commerce" clause, which was also virtually established before the Civil War, as a prohibition upon state power [*Cooley v. The Board of Wardens*, 53 U. S. 299 (1851)]; the interpretation of the "due process of law" clause of the Fourteenth Amendment, first adopted in *Mugler v. Kansas* (123 U. S. 623) in 1887, as requiring that legislation affecting "liberty" and "property" be "reasonable," that is to say, reasonable in the judgment of the court; a series of holdings whereby the "liberty" thus protected has been gradually extended to all valuable personal rights [*Holden v. Hardy*, 169 U. S. 366 (1898); *Near v. Minn.*, 283 U. S. 697 (1931)]; the holding definitely adopted in *Smyth v. Ames* [169 U. S. 466 (1898)] that charges set by public authority must yield what the court finds to be a "fair" return on the "value" of the property involved. Underlying most if not all of those holdings is the principle suggested by Marshall in *Brown v. Maryland* [25 U. S. 419, 444 (1827)] that it is not the *form* of a challenged statute

but its *substantial* operation which is determinative of its constitutional validity. It is in reliance on this principle that the court discarded the historical definition of due process of law as a *form* of procedure for the above conception of it which renders it immediately protective of *substantive* rights; and for the same reason, in applying this conception, the court may recanvass the entire factual situation which the legislature had before it when enacting the challenged statute [*Burns Baking Co. v. Bryan*, 264 U. S. 504 (1922)]. Indeed its interpretation of the due process of law clause of the Fourteenth Amendment today confers upon the court a practically discretionary veto power upon every state legislature. Sometimes this veto is mildly exercised, as between 1910 and 1920; at other times it is applied with considerable rigor, as from 1920 to 1930. Whether it is applied laxly or strictly depends upon no storable rule but upon the social philosophy of the majority of the justices.

The principal basis of "national" judicial review has always been the terms in which the congressional powers are granted, although at times the court has also ventured despite the clear terms of article VI, paragraph 2, to erect state power into an independent restriction on national power [247 U. S. 251 (1918)]. In recent years moreover the court has resorted more and more to what may be termed "covert" judicial review by giving an act of Congress a narrower application than it was intended to have in order to "avoid a grave constitutional issue" [156 U. S. 1 (1895); 213 U. S. 366 (1909)].

The power of the Supreme Court in the "national" and "federal" fields of judicial review rests to an important extent upon the difficulty of amending the national constitution. Most of the state constitutions, on the other hand, are amendable with comparative ease. Indeed it may be said that since the development of the modern doctrine of due process of law and the enactment of legislation securing to the Supreme Court the final voice in the application of this test under the Fourteenth Amendment (Act of Dec. 23, 1914; U. S. C. tit. 28, sect. 344c), "state" judicial review except as a means of holding the state legislatures to certain procedures in the enactment of laws has largely lost its *raison d'être*. Hence it is not without significance that by a provision adopted in 1912 the Ohio constitution ordains that with the exception of a certain class of cases "No law shall be held unconstitutional and void by the supreme court without the concurrence of at least all but one

of the judges." This, the first notable check to the development of judicial review in this country, was sustained by the Supreme Court in 1930 against objections based on the "due process" clause of the Fourteenth Amendment and the "republican form of government" clause of article IV, section 4 (*Ohio v. Akron Metropolitan P'k Dist.*, 281 U. S. 74).

The introduction of judicial review into the national constitution was prompted mainly by the very practical necessity of providing an effective and unobtrusive check on the ebullient state democracies which had shown themselves to be enemies of national unity and of vested rights, and this has remained its principal employment. Even so, previous to the Civil War, when the localistic spirit was strongest, both "national" and "federal" judicial review operated in comparatively narrow channels; indeed it is only since about 1890 that it has come gradually to spread beyond statable bounds because of the fact that at that period a majority of the court was indoctrinated with the then prevalent economic and social philosophy of *laissez faire*. Thus whereas before the Civil War acts of Congress had been invalidated in only two cases, nearly forty such cases have occurred since 1890; and whereas state enactments were set aside in fewer than twenty cases before the Civil War, probably twenty times that number of cases have resulted in the disallowance of state legislative provisions during the last forty years.

Champions of judicial review have invariably stressed its importance as an instrument for preserving the constitution; but the truth of the matter is that very few clauses of the constitution have furnished texts for extensive judicial exegesis, while on the other hand the main basis of "federal" review today is furnished by a judicial translation of the "due process of law" clause that is historically indefensible. The "higher law" conserved by judicial review is in fact mainly the *modus operandi* of American business today; and the values which this "higher law" conserves are freedom of individual business enterprise, short of "unethical" practises [253 U. S. 421 (1920)], and the unrestricted flow of commerce throughout the country [243 U. S. 332 (1916)]. The obvious case for judicial review is its tendency to stabilize business conditions nationally by minimizing the disturbing factor of local legislative interference and the opportunity which it occasionally offers for the further clarification and rationalization of public policies. The obvious case against it is its tendency

to postpone needed reforms beyond the period when they could have been most easily and advantageously articulated with the legal and social structure and its tendency to frustrate the prompt and effective application of the law, both state and national, to large interests.

While the written constitution is nowadays an almost universal feature of popular government, judicial review is encountered much less frequently. For some years from a period antedating the World War a prominent group of French publicists vainly urged the adoption of judicial review in France as the logical corollary of a written constitution. The chief obstacle in the way of the idea aside from the lack of a favorable juristic tradition lies in the fact that the *pouvoir constituant* as organized in the French constitution is substantially identical with the ordinary legislative power. For the same reason "national" judicial review has not yet established itself in Germany under the Weimar constitution, although a strong group of publicists have urged its theoretical claims. "Federal" judicial review, however, is specifically provided for (art. 13) and a special Court of State (*Staatsgerichtshof*) exists for its exercise.

Dicey taught that judicial review was a necessary accompaniment of federalism; but in fact it was not a feature of the old German Reich nor does it appear in the Swiss constitution although it is being agitated there. It is, nevertheless, to be found operative to a greater or less extent in Canada, Australia, Mexico, Brazil, Argentina, Venezuela and Austria—all federal states. The country in which it most closely approaches its American model in scope is Australia, but there are two important differences. Since 1907 the High Court of Australia has had exclusive jurisdiction of all constitutional cases whether arising under the commonwealth or the local constitutions. On the other hand, the High Court does not countenance any such doctrine as the modern American doctrine of due process of law. The constitution of the Dominion of Canada is an act of Parliament, the British North America Act of 1867. Since by the action of the Imperial Conference of 1930 all acts of Parliament applicable to the dominions are subject to alteration or repeal by the dominion parliaments (MacKay, Robert A., in *International Conciliation*, no. 272, 1931, p. 520), "national" judicial review in Canada is left on a precarious basis. While "federal" review will doubtless continue, the Supreme Court at Ottawa will in due course probably supplant

the Judicial Committee of the Privy Council as the court of final resort.

Among the new constitutions of central Europe that of Poland definitely forbids judicial review (art. 81); the Czechoslovakian constitution confines it to the question whether the challenged law was properly promulgated (art. 102); and the Austrian constitution accepts it and provides a special tribunal called the High Constitutional Court for its exercise (arts. 137-48 of constitution as amended in 1929) but only apparently upon the application of the national and state governments respectively. For this reason and because of the comparative ease with which the constitution may be amended and because of the immense range of powers assigned the federal government it may be doubted whether this jurisdiction of the High Constitutional Court will prove of material importance. In brief, while judicial review has recently attracted more attention abroad, the actual institutional consequences of this show of interest have so far been negligible.

On the other hand, it is a commonly recognized principle of public law in continental countries that courts of final jurisdiction may inquire whether statutes involved in cases before them were enacted by the proper constitutional procedure. This type of judicial review, if such it should be considered, may be termed "formal," to distinguish it from "material," or true, judicial review. The one is concerned with the procedure of statutory enactment, the other with the substance and content of the statutes. Formal, or procedural, judicial review is much the less rigorous of the two. While a content forbidden by the courts may be supplied by the legislature only in consequence of a constitutional amendment or the reversal by the courts of their unfavorable attitude, a misstep in the process of legislative enactment is usually easily remediable. In the United States "formal judicial review" is encountered only rarely. Most state courts regard the enrolled statute as bearing on the face of it sufficient and irrefutable proof of its authenticity, and the United States Supreme Court has never taken any other view [Dodd, W. F., "Judicially Non-enforceable Provisions of Constitution" in *University of Pennsylvania Law Review*, vol. lxxx (1931-32) 54-93; Field v. Clark, 143 U. S. 649 (1891); Leser v. Garnett, 258 U. S. 130 (1921)].

A., *Justice and Administrative Law* (London 1928); Hewart, Gordon, *The New Despotism* (London 1929).

JUDICIARY. The judiciary of a state may be defined as that body of officials whose work consists in the resolution of complaint, whether between subject and subject or between state and subject, that the laws of the state have been broken in some particular. Since the time of Aristotle it has been a matter of fairly common agreement among thinkers that the judicial power should be regarded in its nature and even more in the persons who administer it as separate from other aspects of political authority. The reasons for this view are embodied in the theory of the separation of powers. A legislature is normally too general and numerous a body to address itself to particular cases; and to leave to the executive the task of applying legislation to particular cases would be to make of it a judge in its own cause. By making the judiciary a body of men separate from either the subject is given an assurance, which he is unlikely to have in any other way, that his problem is independently assessed.

That is not to say that the judicial function can be easily distinguished from either the executive or the legislative. Judges who arrange the order of court business may reasonably be said to be doing executive work. To draw up rules of court, as does the committee on rules of the English judiciary, is to exercise a power which even if built upon an authority delegated by Parliament it is difficult not to call legislative; and when that power includes the right to determine fees it obviously partakes also of the taxing power, the most essential power in legislation. The separation of powers in fact is simply a convenience of arrangement rather than an immutable dogma; in any rigid sense it is unworkable.

This is shown clearly when the function of

judicial decision is considered (see **JUDICIAL PROCESS**). If the theory of the separation of powers were strictly true the judge would do no more than apply to particular situations a body of rules with which he was provided from without and he would at no point be in a position to determine the content of those rules. But there has been in fact no legal system in which the judicial function could be circumscribed in this way. Old rules have to be stretched to cover new situations undreamed of by the makers of the rules; sometimes, as in the case of the fellow servant rule [*Priestley v. Fowler*, (1837) 3 M. and W. 1] and many of the rules of equity, doctrines have been invented out of whole cloth by the judges. Under a written constitution like that of the United States the Supreme Court in fact determines the limits of the legislative power of both Congress and the state legislatures. He who has in his hands the interpretation of the law is by the nature of things its master. For this reason it is desirable in any state that there should be beyond the judicial authority a power capable in important cases, such as the income tax cases of the United States, of overriding the judicial determination in a particular decision. Unless such a power exists, the judiciary is bound to become the effective master of the life and fortunes of the state.

The first great problem that arises in any judicial system is the method by which the judges shall be selected. In western civilization this technique has been of a most varied character. In Great Britain the judges are of two kinds, lay and professional; the former are appointed by the lord chancellor (in the Duchy of Lancaster by the chancellor of the duchy), the latter by the prime minister, the lord chancellor or the home secretary, according to the post involved. All appointments are for life, subject only to good behavior, the latter meaning that no judge of the High Court may be dismissed save by an address to the crown from both houses of Parliament. In Great Britain the person making the appointment has no obligation to consult or to obtain confirmation from any other body or person; it has, however, become the practise in the case of lay magistrates to accept as a rule nominations put forward by committees advisory to the lord lieutenant of the county. In the United States appointments to the federal bench are made by the president, but he must obtain the consent of a majority of the Senate and there have been notable cases (one as recent as 1930) in which the presidential recommendation has been re-

jected. In the states of the American union selection is either by executive appointment, subject to the consent of an advisory body (as a rule either the legislature or the governor's council), or by election. The latter process may consist, as in Rhode Island and Virginia, in election by both houses of the legislature on a joint vote; or, as in most cases, it may consist in election by the ordinary qualified voters of the state, either voting at large, as in New York, or by districts with a separate elected judge from each district. Regulations vary from provision for a non-partisan ballot to implicit permission for ordinary partisan candidatures. Appointed judges in the federal courts sit for life unless removed by impeachment; in the states the grounds for removal are various, the widest perhaps being that of Kentucky, which permits removal "for any reasonable cause." Elected judges sit for widely varying periods, of which the two years of Vermont, the six years of Ohio, the fourteen years of New York and the twenty-one years of Pennsylvania may be taken as examples. It should be added that in Great Britain the heads of the different courts are appointed by the prime minister, as the chief justice of the United States Supreme Court is appointed by the president (the confirmation of the Senate being required), but in the United States the chief justice of the highest state court is selected in a variety of ways: he may be appointed or selected by lot or individually elected or chosen by the court itself or be the judge who has the shortest term to serve or he may be the senior judge, to name only some of the possible variations.

For lay judges in England no qualification is required save the approval of the appointing authority; for professional judges a minimum period of seven years' service at the bar is required. A newly appointed judge may go directly to the highest court of the land; and it is rare for the head of the whole judicial system, the lord chancellor (who is a member of the cabinet), to have any previous judicial experience. The qualifications demanded in the United States are more various. None is formally required of federal judges by the United States constitution; in the state constitutions are found qualifications as to age (twenty-five being the lowest), character, education, residence and length of practice (in Louisiana for as long as ten years) at the bar of the particular state.

The appointive system without legislative confirmation exists in the British dominions and colonies; and it may therefore be broadly said

that the basis of judicial selection in the territory where the common law prevails is either appointment or election, with a bias in favor of the former. On the continent of Europe a totally different system prevails. There the judiciary may be briefly described as a special civil service recruited by a special examination and without organic relation, as in Great Britain and the United States, to the bar. A Frenchman or a German becomes a judge in the same way as an Englishman or an American becomes a lawyer, save that there are a limited number of vacancies every year. Appointment from without is a rare exception. Promotion, after the original appointment by examination, is dependent upon the will of the executive; and there are all the usual guaranties of judicial tenure. The Swiss system, on the other hand, more nearly resembles the American. The judges of the highest federal court are elected by the federal legislature, and in the cantons there is every variation from appointment by the executive to direct election by popular vote. In the new Spanish constitution (1931) executive appointment prevails; but the minister is assisted in his choice by a council, whose verdict is intended to have considerable weight in the decision.

What is to be said of these different methods? With the British system of lay magistrates it is difficult to express any satisfaction. They are chosen mainly as a reward for political service—the last motive which should enter into judicial appointment. Save by accident they have no professional competence, and in any case which involves something more than common sense they tend to be at the mercy of the clerk of the court who acts as their technical adviser. Since moreover they do not sit continuously—the average magistrate sits for a fortnight in the year—there is a wide range of variation in punishment for similar offenses, depending largely upon the views and temperament of particular magistrates. On the basis of British experience it must be concluded that the place for the lay mind is emphatically in the jury and not on the bench.

The system of executive appointment has clearly much to commend it where it is carried out in a really responsible way. Its danger is that, in the absence of a need to secure confirmation for the executive choice, motives irrelevant to fitness for judicial position may enter into the appointment. In Great Britain, for example, it is certain that a place on the bench has only too often been a reward for political services, and there has been a tendency to reserve the highest

places on the bench for men who have occupied high political office. It is notable, for instance, that every lord chief justice of England in the last sixty years has, with one exception, been an ex-attorney general; and that exception was a judge who agreed to hold office until it was convenient to the government of the day to release the then attorney general. No doubt there have been few really dubious appointments under the British system; but it is worth remarking that the greatest British judges of the nineteenth century were either not politicians at all or were men who did not suit the atmosphere of the House of Commons. In so far as British experience may serve as the basis of generalization, its lesson seems to be that the unfettered discretion of the executive is not the best way of appointing judges.

The system of legislative confirmation has much more to be said for it. Certainly in the United States it has prevented bad appointments by compelling the executive to take account of what public opinion may say when his choice is made known. It has, however, clear weaknesses. It may tend to inject purely partisan considerations into the process of confirmation. It gives opportunity, as in the famous case of Justice Brandeis in 1916, for strong vested interests to work against a nomination which they suspect may be hostile to them. There is, finally, a chance for the display of all the vices of a corporate body when the choice of the executive falls upon one of its own past or present members. It would not be an unfair summary of American experience to say that confirmation of executive appointments is desirable but that it is not clear that the legislature should either in whole or in part be the source of the power to confirm.

A priori the case against the popular election of judges would seem to be unanswerable, especially where the term of office is short. The qualities which go to make a good judge are rarely to be discriminated by a vast and amorphous body like an electorate; and the necessity for reelection is not helpful to that independence of mind without which no judiciary can do its work adequately. It should, however, be said that the system has not worked badly in Switzerland and that in the United States it has produced some judges of a very high order. But success in a lottery is not an argument for lotteries; and most observers would probably agree in regarding the elective system as bad in principle and generally unsatisfactory in experience.

The system of a judicial civil service has much to commend it. So far as original appointment is concerned, it provides a notable safeguard against favoritism in nomination; and the esprit de corps engendered has certainly given to France a body of judges distinguished by their learning and technical competence. Its weaknesses, it may be argued, are twofold. The very fact that it is a civil service tends to make it both conservative in outlook and excessively formalistic in method; it tends to emphasize the procedural rather than the substantive side of law. And the fact that promotion is an internal matter tends to deprive it of the services of men who come to the problems of the law with a knowledge of the world outside the courts and therefore something of the statesman's insight. A system like the French may produce judges to rival Story in eminence or Willes in learning; it will hardly produce judges with the breadth of outlook of Mansfield or Marshall. And it may be argued that in the process of adjusting law to life the power to produce and use men of the stamp of Mansfield and Marshall is essential to the full success of a judicial system.

The implicit lesson of all this experience seems to be the desirability of executive appointment, subject to control by an advisory body. The latter should not be political in complexion nor should it be dominated by a purely professional element. Such a body should be relatively small in numbers, and in the event of disagreement with the executive the reasons for its decision should be made known. It is desirable that its members should sit for a considerable term of years and that they should not change with a change in the character of the executive. It is very improbable that purely partisan or wholly undesirable appointments would be submitted to such a body for confirmation; and it is at least possible that as it developed traditions it would prove a bulwark of safety in the assessments of fitness for judicial office.

Certain other problems remain. Experience suggests that the irremovability of judges, save for serious misconduct, is fundamental to the preservation of their independence; and the Anglo-American method of removal only by legislative action seems as useful a procedure as can be devised. It is always possible to use it, but the very gravity of the method reserves it for use only on the most important occasions. Too little attention, however, is given to the problem of establishing a proper retiring age. Judges do not often reach really important places

until they are fifty or over; and as a pension is seldom afforded until some fifteen or twenty years have elapsed, judges are frequently old men who have lost touch with the ideas of a new generation. Recently, for example, the average age of the judicial committee of the British Privy Council was over seventy-five. On the other hand, it is certain that some of the finest judicial work of modern times has been done by men of advanced years; and the case against too early a compulsory retirement is proved by instances like Lords Lindley and Macnaghten in England and Mr. Justice Holmes in the United States. It is clearly undesirable, however, that a judge should himself be the sole determinant of his fitness for continuing to function. The problem could be met by fixing a normal retiring age of seventy-five, with a power in the proposed advisory committee to the executive to extend this period annually where it seems desirable. In general this would mean that the average judge had done some twenty years' service at the time of his retirement while the exceptional judge would be able to make his activities on the bench span the experience of a whole generation.

A further problem is raised by the relation of judges in inferior to those in superior courts: the difficult question, in short, of promotion. In a judicial system like that of France the limitation of the sources of recruitment offers a reasonable prospect to the judges of a lower court that performance of merit will be given some weight in the assessment of promotion. Influence and even political opinions doubtless have their part; but the notion of appointment by merit has its effective place in the system. In England, however, there has been no case in which a police magistrate has been promoted to the county court and only one case in which a county court judge has been appointed to the High Court, while in the last seventy-five years the highest judicial offices have been filled far more often directly by first appointments than even by promotion from the High Court. In the American federal judicial system promotion from the district court to the circuit court has been fairly frequent but promotion from either to the Supreme Court has been exceptional. Thus in England and to a lesser degree in the United States the system tends to discourage able young men from accepting positions on inferior courts because of the knowledge that their judicial career will too often end there; and it also tends, especially in England, to staff the inferior courts with middle aged men who have not been successful enough at the

bar to hope for the distinction of high judicial appointment. Any serious consideration of the problem of judicial appointment will have to pay attention to these implications, for they tend to make the work of the popular courts unsatisfactory in quality and, further, to multiply appeals—a serious matter where, as in England and America, litigation is expensive.

Anglo-American practise has widely diverged from that of the European continent in its insistence that the place of ultimate decision for all legal problems shall be the ordinary courts of law. Although the growth of state functions has led to the development in both England and the United States of all kinds of special tribunals, some of which are staffed by officials who are not trained in the law, the legal problems, especially in the realm of *vires* to which the decisions of these tribunals give rise, have always been settled in the absence of special statutory provision by the House of Lords and by the Supreme Court. The doctrine underlying this practise has been that the citizen is not assured of the full rule of law unless his rights may be determined, at least in the last resort, by a tribunal independent of the executive power.

Upon the continent a different view has been taken. The theory of the separation of powers regards executive and judiciary as upon an equal footing; for the latter to control the acts of the former would therefore be a violation of principle. Therefore cases which concern the activities of ministers or civil servants when acting in their official capacity come before special tribunals known as administrative courts, in which the claims of the parties are determined by judges usually specialized to this type of work. In this way cases involving the administrative process are judged by men who are acquainted with the special problems to which it gives rise; and they possess the necessary *expertise* to handle the quasi-judicial issues which are involved. Such tribunals, further, have the merits of flexibility, cheapness of procedure and rapidity of decision, which are seldom characteristic of the ordinary courts of law. It is tolerably certain that most of the Anglo-American criticism of administrative tribunals, at any rate as applying to France and Germany, is misconceived. *Droit administratif* is in both countries a well settled body of law; those who apply it have all the necessary training, both legal and technical, for the special problems they settle; and the special merits claimed for such tribunals do in fact characterize their operation. Nor can it be

said that, at any rate for the last sixty years, there has been lacking in these courts that independence which assures proper standards of impartiality of decision. In so far as it is desirable to separate public from private law—a problem of grave theoretical complexity—the system of *droit administratif* has in the last two generations satisfied all the canons of adequacy by which a judiciary is normally tested. In particular, it is worth emphasizing that the Conseil d'État in France has shown that a body of civil servants can display all the highest qualities of a great court of law.

The development of administrative tribunals in Anglo-American countries has given rise to special problems upon which judgment is more difficult. Certain conclusions, however, are clear: the growth of state functions gives rise to issues of fact of a highly technical nature for the settlement of which the purely legal training of the judge is not necessarily adequate; the volume of work done by administrative tribunals is so large that to allow appeals from them to the ordinary courts would congest the latter to an impossible point; most administrative cases involve the exercise of an executive discretion which can be properly appreciated only by officials concerned with the results of policy, and to have such discretionary problems determined by the ordinary courts is to leave to judges decisions upon questions which are not legal at all; administrative tribunals can work more flexibly, cheaply and quickly than the ordinary courts.

In these conclusions there is a truth which it is impossible to deny. Few impartial observers can doubt that the record of the English courts in quasi-judicial cases (e.g. statutes relating to housing legislation, workmen's compensation and the like) or of the Supreme Court of the United States in valuation cases has not been wholly happy. The ordinary judge cannot be expected to have *expertise* in these matters, and his training in the rules of the common law tends to make him approach issues of public administration from an unhelpful angle. But if administrative tribunals are to command public confidence it may be suggested that their membership must satisfy certain historic canons on which public confidence appears to depend. Their composition must be stable in character. The minister or department head must not be able to change their membership at his discretion or to overrule their findings on issues of fact where they exist to determine such issues. The men appointed to such tribunals must be known and chosen for

their competence in the theme of their particular jurisdiction. Such tribunals should moreover always contain a legal element. These canons are in fact satisfied by the French and German systems; it cannot be said that they have yet been satisfied in the tribunals which the necessities of the modern state have led Great Britain and the United States to erect.

Certainly the problems to which the extension of administrative jurisdictions gives rise are from the angle of the judicial function grave ones. If the determination of cases may be finally left to officials who do not necessarily have legal training or security of tenure and who do have an administrative interest in the result of the case, an appeal from their decision on suitable legal grounds would seem a priori to be a proper way of safeguarding public confidence in them. It is also urgent that their work should be done with adequate publicity and should be accompanied by explanations of the results. On this basis there seems no reason why in suitable cases the delegation of administrative decisions should not take place upon an increasing scale. Purely judicial questions could still be left to the ordinary courts; but there is no reason to suppose that with appropriate safeguards non-legal members of administrative tribunals could not do quasi-judicial work wherever their special competence is likely to prove of value. Any other attitude is a sacrifice of relevant experience to the requirements of a theory of the separation of powers which the progress of doctrine has made it increasingly difficult to defend.

This is, in short, to argue that there is a realm in which decisions that have a legal bearing require lay judges rather than the traditional experts of the law, always on the assumption that the requirements of law are properly safeguarded. But if in quasi-judicial decisions a mixture of special competence is likely to produce the most adequate result, the same principle may also be extended to the normal processes of the courts. It is difficult to see why the judge there should not be assisted by lay assessors competent in some special aspect of the decision he has to make. The desirability of this procedure is already admitted, for example, in the British Court of Admiralty, where naval assessors sit to assist the judge on technical points. Is it not at least equally desirable that the judge should be assisted on medical questions by expert medical assessors and on engineering or valuation problems by experts on engineering and valuation? The present position, in which the judge is left

to find his way between the disparate opinions of expert witnesses upon highly technical matters about which only too often he is hearing for the first time, can hardly be regarded as satisfactory. It assumes that a legal training combines with a judicial frame of mind to give birth to an omniscience which is hardly borne out by the decisions themselves. It is even possible to envisage the time when the process of inflicting sentence in a criminal case will depend less upon judicial intuition of what the case is worth as a crime than upon a series of recommendations from experts in criminal psychology and social welfare work who advise the judge as permanent officers of the court.

One final aspect of the place of the judiciary in the modern state deserves a word. There has never been any considered effort in modern times to relate the judicial function organically with the vital process of improving the law. From time to time the public is made aware of legal inadequacies by the *obiter dicta* of judges, and from time to time its opinion has been sought, either individually or collectively, upon particular problems. In England there is even provision in the Judicature Act of 1873 for a council of the judges with suggestions for legal improvement as one of its aims, but it is said that the council has not met half a dozen times since the statute was passed and has not on any of these occasions transacted important business. The Supreme Court has on occasion effected useful procedural changes although of a minor character, but it has never as a corporate body sought to inform the executive or the legislature upon desirable improvements in the law.

Work of this kind ought to be an inherent part of the judicial function. One of the many difficulties that law reform confronts is the technical character of its subject matter, of which the result is a serious limitation of the part that the layman can play in its improvement. The lawyer no doubt has always been a conservative force in society and the stability he largely protects has its own special social value. But this does not rule out the desirability of obtaining from the judiciary in a regular and coherent way their view of the state of the law and the means they would take, especially in urgent aspects, for its improvement. To allow their experience of its operation to go unutilized is surely a waste of an important source of social knowledge. Anyone who compares our present conception of legal institutions with the ideal, for example, set out by Bentham in his *Constitutional Code* will find it difficult to

resist the conclusion that the mere rendering of judicial decisions, no matter what the distinction with which it may be done, does not exhaust the services the judge can perform. There must be few judges, to take an obvious example, whose experience has not led them to a considered view of the value and limitations of the jury system, yet our knowledge of the burden of that experience is limited to an occasional remark in a biography rarely fortified by serious argument. Nothing, it may be argued, is more likely to augment the respect for judges or is more certain therefore to increase the regard in which law itself is held than the deliberate attempt to provide institutional channels for the expression and utilization of judicial experience, which are now wanting.

JUGLAR, CLÉMENT (1819-1905), French economist. Juglar was a physician but abandoned his practise in 1848 and devoted himself entirely to the study of economic problems. He became a member of the Société d'Économie Politique in 1852, was one of the founders of the Société de Statistique de Paris in 1860 and was elected a member of the Académie des Sciences Morales et Politiques in 1892.

Juglar's interest centered chiefly in the problem of business fluctuations. His *Des crises commerciales et de leur retour périodique en France*,

en Angleterre, et aux États-Unis (Paris 1862, 2nd ed. 1889; tr. by De C. W. Thom, 3rd ed. New York 1916), which won the award of the Académie des Sciences Morales et Politiques, marks a turning point in the study of business crises. It is a painstaking study of changes in commodity prices, interest rates and bank balances in which Juglar for the first time demonstrated the rhythmic, cyclical character of economic activities. His other prize winning study, *Du change et de la liberté d'émission* (Paris 1868), is a useful study of the exchanges at the end of the eighteenth century and the beginning of the nineteenth. In 1865 Juglar was commissioned to translate the text of the English bank investigations which were largely concerned with commercial crises, and he gave valuable testimony when a similar investigation was organized in France. He published a large number of articles in the *Annuaire statistique*, the *Journal des économistes*, the *Journal de la société de statistique de Paris* and in *Économiste française* and wrote the articles on banks and on crises in Say's *Dictionnaire des finances*.

JULIANUS, FLAVIUS CLAUDIUS (Julian the Apostate) (331 or 332-63), Roman emperor. Julian, who was the son of a half brother of Constantine the Great, was born at Constantinople. In the massacre which after Constantine's death (337 A.D.) freed his sons from the rivalry of the emperor's other relatives only Julian and his elder half brother Gallus were spared. Both suffered from the suspicions of the emperor Constantius and were forced to spend six years on a remote imperial estate in Cappadocia. About 347 Julian was allowed to return to Constantinople. During his subsequent travels in Asia Minor he became a disciple of the neo-Platonist philosophers. For a short time he studied also at the University of Athens. In 355 Constantius sent him as Caesar to Gaul. Julian won a decisive victory over the Alemanni at Strasbourg and reorganized the administration of the province. In 360, when Constantius ordered troops from Gaul to march to the east to repel the Persian attacks, the army in Gaul revolted and proclaimed Julian emperor. The death of Constantius prevented civil war, and Julian succeeded to the throne in 361.

Upon his proclamation as Augustus, Julian professed openly for the first time the faith to which his studies and meditations had converted him—Hellenism. Just as Constantine had consistently endeavored to base the security of the Roman Empire upon a close alliance between the state and a united Christian church, Julian the Apostate sought to secure the prosperity of the empire through a revival of the worship of the ancient gods. Christianity was a menace not only to the pagan faith but to Greek culture as a whole, for in Julian's mind the faith and the culture were identified. Believing that only a reformed paganism could successfully resist its rival, he tried to create a pagan church. His tragedy lay in the fact that he gave to paganism a reinterpretation for which in the popular conception of the ancient faith there had been no adequate preparation; his fiery enthusiasm met for the most part only with indifference or ridicule. In 363 Julian was killed during the retreat which followed his invasion of Persia. Although at the outset of his reign he had professed a policy of religious toleration, imperial favor had soon become limited to the pagans. On his departure for Persia his animosity against the Christians was so violent that in the opinion of many had he returned he would have inaugurated a fresh persecution. His backward look in religion was matched by a political archaism seeking to restore the authority and prestige of the Senate. In the sphere of administration his passion for reform was practical and unmystical, especially his efforts to increase the membership and the financial capacity of the municipal senates, to reduce the expenditure of the imperial court and to render justice swift and impartial.

NORMAN H. BAYNES

Works: Julian's complete works, *Iuliani imperatoris quae supersunt praeter reliquias apud Cyrillum omnia*, were published by F. C. Hertlin, 2 vols. (Leipzig 1875-76), tr. by W. C. Wright, Loeb Classical Library, 3 vols. (London 1913-23); his laws and letters, *Epistulae leges poemata fragmenta varia*, were edited by J. Bidez and F. Cumont (Paris 1922).

Consult: Bidez, J., *La vie de l'empereur Julien* (Paris 1930); Geffcken, J., *Kaiser Julianus*, *Das Erbe der Alten*, vol. vii (Leipzig 1914); Simpson, W. Douglas, *Julian the Apostate* (Aberdeen 1930); Ensslin, W., "Kaiser Julianus Gesetzgebungswerk und Reichsverwaltung" in *Klio*, vol. xviii (1922-23) 104-99; Baynes, N. H., "The Early Life of Julian the Apostate" in *Journal of Hellenic Studies*, vol. xiv (1925) 251-54.

JULIANUS, SALVIUS, Roman jurist. He was born at Hadrumetum in Tunis toward the end of the first century A.D. He succeeded his teacher

Javolenus as one of the heads of the Sabinian school but was destined by the authority of his writings to close its traditional rivalry with the Proculian school. Julian's fame depends on his share in Hadrian's legal reforms and on his *Digesta*. The earlier emperors had left the development of law to praetors and jurists, but with the growth of the imperial system the independence of these authorities had become anomalous and indeed unreal. Hadrian terminated the further development of praetorian law by confiding to Julian toward the close of his reign the task of stereotyping the Edict: Julian's Edict and no other was to be issued by future magistrates. It was a work of ripe judgment rather than of originality, embodying few departures from the traditional form. Hadrian also associated the juristic development of law more closely with the imperial authority by including the leading jurists, with Julian as chief, in his reorganized council, of which he so extended the civil jurisdiction that rescripts nominally imperial but actually settled by the legal members became a main instrument of other than statutory legal progress. Julian's *Digesta*, covering the whole law in ninety books (printed in Lenel, Otto, *Palingenesia iuris civilis*, 2 vols., Leipsic 1889, vol. i, cols. 317-484), belongs probably to the reign of Antoninus Pius when he was at the height of his great official career. This work, unequalled in influence except perhaps by Labeo's, became the basis of the commentaries of Ulpian and Paul and is the forerunner of Justinian's own Digest. What remains of it (through Justinian) is casuistic and practical; probably its dogmatic expositions have been suppressed in favor of those of Paul and Ulpian. Julian died presumably early in the reign of Marcus Aurelius and Verus, having preserved until an advanced age, as he says himself (*Dig.* 40, 5, 20), with one foot in the grave the thirst for learning. The emperor Didius Julianus was his grandson or great grandson.

Julien," and "Le vrai et le faux Sénatus-Consulte Juventien" in *Revue historique de droit français et étranger*, 3rd ser., vol. xxxiv (1910) 731-93, and 4th ser., vol. ix (1930) 1-19, 621-68; Kalb, Wilhelm, *Roms Juristen, nach ihrer Sprache dargestellt* (Leipsic 1890) p. 57-61; Rechnitz, Wilhelm, *Studien zu Salvius Julianus* (Weimar 1925), and the review by Eduard Fraenkel in *Zeitschrift der Savigny-Stiftung für Rechtsgeschichte*, Romanistische Abteilung, vol. xlvii (1927) 397-414.

JURIEU, PIERRE (1637-1713), French Huguenot publicist and ecclesiastic. Jurieu served as pastor at Mer and later as professor of theology and Hebrew in the Calvinist academy at Sedan. In 1681 he was exiled from France and went to Rotterdam. An ardent controversialist and a skilful writer, he was soon involved in many religious disputes not only with his Catholic opponents but also with his Walloon sympathizers and coreligionists. His most celebrated theological adversary was Pierre Bayle, the French critic and philosopher. Jurieu's religious writings, however, have not attracted much attention. His reputation rests upon his political works. Influenced by the revocation of the Edict of Nantes he opposed in his *Préservatif contre le changement de religion* (The Hague 1682) and *Lettres pastorales adressées aux fidèles qui gémissent sous la captivité de Babylone* (Rotterdam 1686; English translation, London 1689) the divine right theory so cleverly defended by Bishop Bossuet. Jurieu also became a leading exponent of popular political and religious liberty and was one of the outstanding exponents of the idea of the sovereignty of the people in the seventeenth century. A pamphlet attributed to him, *Les soupirs de la France esclave qui aspire après la liberté* (Amsterdam 1689; English translation, 3 vols., London 1689-90), contained such a true picture of the political changes which occurred after its publication that it was reprinted a century later under the title *Les vœux d'un patriote* (Amsterdam 1788).

JURISDICTION. The concept jurisdiction (from the Latin *jurisdictio*, which means speaking by the law) appears in the Roman law and also in the modern civil and common law systems. It is at once too elemental and too ambiguous to be defined. It is perhaps an ideal prototype of a law term which seems to have

definite meaning but which reduces itself on analysis to a mere focal point for a variety of arguments applicable to a variety of dissimilar problems. The arguments are usually couched in negative form: that there is no jurisdiction or that a particular act will be or was in excess of the court's jurisdiction. The nature of jurisdiction can best be appreciated by considering when such arguments are appropriate and what they can accomplish.

A fundamental principle is that without jurisdiction there is no capacity to act as a court. The individuals who hold judicial office may behave as though they were holding court. They may announce their views in formal writing with signatures and seals as though they were pronouncing judgment, but the document is not a judgment. It is a "nullity." If execution issues to enforce it, those levying execution are not protected nor can title pass to purchasers on execution sale. No other court will aid in enforcement of the judgment or recognize it as settling a disputed issue. These consequences, however, follow only if the lack of jurisdiction is pointed out. Otherwise the void judgment may pass as valid. The usual method of making timely application to the court which rendered a judgment or to the proper appellate court to set aside the judgment for lack of jurisdictional basis is called direct attack. Collateral attack, on the other hand, is an allegation that a judgment is void for lack of jurisdictional basis made in a proceeding other than the one in which judgment was rendered.

As collateral attack may involve in serious hardship those who have relied on seemingly valid and final judicial action, every effort is made to limit its availability. This is done by permitting no argument except lack of jurisdiction and by allowing only the narrowest scope to that argument. Thus the ideal test of the logical validity of an argument in jurisdictional terms becomes: is there ground for collateral attack? It is a test which few jurisdictional arguments could meet.

In fact no attempt is made to save lack of jurisdiction untarnished for use on collateral attack. It takes its place with other arguments at every stage in a lawsuit as a reason for inducing a court to refrain from acting or to set aside past action. Counsel asking dismissal are always tempted to say for emphasis that their reasons go to the very jurisdiction of the court. Judges writing opinions fall to talking in jurisdictional terms partly because it is easier to adopt counsel's argument than to fashion explanation of

their own, partly because this seems the easiest way to impress the disappointed litigant with the fact that it is the law not the judge that refuses to hear him. The resultant descriptions of what goes to a court's jurisdiction differ with the situations in which they are used. Different considerations apply to prompt and delayed assertion of jurisdictional objections, to direct and collateral attack, to collateral attack on default and contested judgments, to those protesting on jurisdictional grounds alone and to those seeking to preserve a second line of defense on the merits in case their jurisdictional defense fails. Each situation requires its own balancing of the objections to the court with the desire not to delay or defeat litigants on technical grounds.

Different balances are struck in civil and criminal actions. In civil procedure many subtle refinements make for stability. Sometimes a jurisdictional objection may be "waived" by not raising it or by attempting also to preserve a defense on the merits. Again, the logic may lead to the paradox that even a court without jurisdiction has a limited jurisdiction to pass on an objection to its jurisdiction; its decision may be erroneous, yet it is subject to correction only by prompt appeal. If it decides that it has jurisdiction and enters judgment, the judgment will not be subject to collateral attack, for the issue as to its jurisdiction is *res judicata*. Again, the reason why a particular court is inappropriate may be called something else than a rule of jurisdiction—merely a matter of venue. In such a case disregard of it would not affect the validity of the judgment on collateral attack.

Such stabilizing devices are much less prominent in the criminal law. On the contrary, the writ of habeas corpus, originally devised to release prisoners "unlawfully" detained, as by order of a court acting without jurisdiction, has become simply one more method of appeal. The pressure to protect the defendant is here much stronger than in civil actions. To secure summary release or release after it is too late to appeal it is necessary for a court issuing the writ merely to say that the error deprived the former court of jurisdiction or at least that the judgment rendered was in excess of its jurisdiction. Thus the concept of jurisdiction having become attached to a remedy expands as new uses are found for the remedy, and eventually there is a shift from argument that the court is inappropriate to review of any gross error of substantive law or procedure, such as violation of a constitution.

Behind and overshadowing the attempt to fix the limits of a particular court's jurisdiction may be some fundamental struggle for power, such as those which have occurred between church and state, feudalism and centralized monarchy, centralized monarchy and a rising middle class, executive and legislature, federalism and states' rights, debtors and creditors, agrarian and industrial interests, economic conservatism and radicalism. Sometimes the stake is only in the prestige and revenue to be derived from holding court or appointing judges. Sometimes the ultimate objective is the disposition of particular types of litigation and the struggle is to get them before the courts deemed most likely to reach the desired results.

As far as the appropriateness of a particular court is concerned, it is affected by the nature of the plaintiff's claim, the amount in dispute, the status, residence and presence of the parties, their submission to the court and the observance of procedural prerequisites, such as service of process. Where the distribution of judicial business is a major political issue, whatever compromise is reached is naturally not subject to modification at the whim of litigants. A technical expression of this is that lack of jurisdiction of the subject matter cannot be waived by a defendant, although he may waive lack of jurisdiction over his person. But the historical political issues may lose importance with the lapse of time. The result may be a feeling that it would be too arbitrary and technical to dismiss a suit where it appears at a late stage that plaintiff has begun in the wrong court. Again the escape is by warping terminology. So far as a court can define the objection as not going to its jurisdiction over the subject matter it is free to dispose of the problem as justice to the litigants may require.

These are but scattered illustrations. A complete account of the situations where argument has been in jurisdictional terms would run the gamut of legal and constitutional history without being particularly illuminating. The analysis would tend to obscure rather than elucidate the social aspects of the actual problems. It is better to deal with specific problems and to examine the part which other concepts as well as jurisdiction play in their determination. One most important problem is the geographical distribution of judicial business—the place of trial.

The simplest treatment of the problem is to make a preliminary inquiry as to the testimony which each party wants to present and to arrange the place of trial with regard to the convenience

of the parties and their witnesses, the date at which trial can be had and the relative burden on those whose taxes support the courts and who render jury service. The modern English practice provides for determining the place of trial within the country by discretionary order of court in the light of such considerations.

This result was approached also by the later common law in a more intricate and indirect way. Actions were classified as either local or transitory, the former consisting chiefly of actions concerning land. If the action was local, the plaintiff had to designate as the county for trial that one wherein his claim arose; otherwise he might designate any county in England. The place of trial thus designated was called the venue. The defendant could obtain a change of venue of a transitory action if the county selected by the plaintiff was inconvenient. The venue of any action might be changed if it was impossible to obtain a fair trial in the original county.

The common law rules can be appreciated only if they are considered in the light of the court system of which they were a function. The royal courts were all centralized at Westminster. There original writs were obtained, pleadings exchanged and points of law argued. Unless the proceedings at Westminster finally disposed of a case on a point of law they would culminate in an issue of fact for trial by jury at the assizes. The judges of the central courts and counsel rode the circuit of the various counties to conduct the jury trials. Under such circumstances the place of trial became merely one procedural incident in the trial of a case.

It is when the localized jurisdiction of courts is considered and place of trial is confused with the plaintiff's selection of a court that troubles begin. Here talk is likely to be in jurisdictional terms with metaphysical bugaboos lurking in every thicket. Thus the logic which describes action by a court without jurisdiction as a nullity makes it impossible to consider a case as pending until it has been brought in a court that has jurisdiction. Even a court with jurisdiction cannot simply order the case transferred to a court of another state or nation as more convenient for trial. The result is a common assumption of necessity to choose between trial in the court where the plaintiff has begun and a dismissal which forces him to start all over again elsewhere, thereby delaying him, perhaps depriving him of the advantage of having attached property of the defendant, perhaps barring his action altogether,

if meanwhile the statute of limitations has run.

In so far as this difficulty arises under the American state system of semi-autonomous county courts it can be and frequently is obviated by statutes providing that where the plaintiff has begun in the wrong county court the defendant's only remedy is to move seasonably to change the venue to the proper county court. Substantially the same result might easily be achieved on an interstate or international scale. The court where the plaintiff has begun his action might, on the defendant's objection to the forum as inconvenient, stay or dismiss the action upon condition that the defendant make stipulations which would have the same effect as though there were a change of venue to some other state. The defendant could be required to waive service of process in the other state, to agree not to plead the statute of limitations and to furnish substitute security in case the plaintiff had attached property in connection with his original action. Jurisdiction would then concern itself only with the problem of the appropriateness of the courts of a particular state to pass on the preliminary question of the proper place for ultimate trial of the case. Since the preliminary question would be handled on motion and affidavit, no difficulties of transporting witnesses would arise.

But the treatment of the problem has not been that of a simple matter of procedure; it has exhibited mechanical jurisprudence at its worst. The common law distinction between local and transitory actions has been laid down as though it involved principles of inherent justice, and its historical origin as an incident of a particular system of courts has been ignored. The rule that the plaintiff may lay the venue of a transitory action where he chooses has been transferred from county to interstate scale without the county qualification that the defendant may obtain a change of venue where the plaintiff has designated an inconvenient place. The rule that actions for injury to land are local has resulted in complete denial of relief to the plaintiff when the defendant has not been subject to the jurisdiction of the courts where the land is. The attempt is made to get along with historic categories that go back to primitive notions as to the necessity of having a defendant physically in court and consenting to a particular method of settling the controversy. The modern method is to give the plaintiff judgment by default after the defendant has been notified to appear. But early common law procedure involved resort to a series of co-

ercive measures culminating in outlawry: when the defendant was forced to appear, weights were put on his chest until he "consented" to jury trial.

The foundation of jurisdiction is still said to be physical power, but the physical basis for the "power" becomes more and more metaphorical. Attempt has been made to classify the bases for jurisdiction over a defendant as presence (however transient) at the time of service of process, consent (which might be coerced or "implied") and allegiance (citizenship, domicile or perhaps a residence which was less than domicile, if the defendant were temporarily outside the state). These concepts have been worked out as though the norm of litigation were an individual defendant, whereas today most jurisdictional problems involve enforcement of vicarious liability: claims against foreign corporations and other business associations and non-resident individuals who carry on business within the state through local agents. Perhaps the one notable exception is the non-resident motorist, and there the real party in interest is likely to be a corporate insurer. Various American statutes have required non-residents engaging in local activity to designate local agents, sometimes state officials, on whom process might be served. Questions have arisen as to whether these statutes did or could extend to claims arising outside the state and as to the effect of non-compliance. Could consent be implied from the conduct of business within the state; could the foreign corporation be regarded as present wherever it did business; was jurisdiction dependent on the power of the state to exclude the business altogether; or was it merely an incident of a general "police power" to regulate any business conducted within the state? Where it is not possible to satisfy the requirements of jurisdiction over the defendant, there may be jurisdiction over his property or over debts owed to him, and there may be a proceeding *quasi in rem* to apply the property or debts as far as they will go in satisfaction of the plaintiff's claim.

The law of interstate jurisdiction has developed as constitutional law. The full faith and credit clause of the federal constitution has been held to require recognition of a judgment of a sister state only if the court which rendered it had jurisdiction. The due process clause of the Fourteenth Amendment has been held to be violated by the entering of judgment without jurisdiction. The power of the Supreme Court to review state decisions under these two provi-

sions has created a federal law as to the limits of jurisdiction which a state can confer on its courts. The tendency of state legislation has been to provide new machinery and the tendency of the federal law has been to expand jurisdictional concepts to justify legislation, affording plaintiffs ever wider opportunity to bring suit at forums convenient for them.

These enlargements of plaintiffs' choices of forums have made possible vexatious selections. Forums are chosen not because they are convenient for plaintiffs but because they are highly inconvenient for defendants. This has been particularly notorious in the field of personal injury litigation against interstate railroads and the method has been combined with highly organized "ambulance chasing." Lawyers in states known to be good plaintiffs' states have employed agents to secure personal injury litigation from distant states. Defendants have tried to meet this strategy by asking the court selected by a plaintiff to dismiss on grounds of convenience and, failing in this, by raising objections to the jurisdiction under the due process clause. Moreover by asserting that the exercise of jurisdiction would be an interference with interstate commerce contrary to the commerce clause of the federal constitution defendants attempt to carry these constitutional issues if necessary to the Supreme Court of the United States. They have also gone to courts of plaintiffs' domicile and sought equity injunctions against the maintenance by the plaintiff at law of his action in a remote and inconvenient forum. Where the plaintiff has no substantial property at his domicile and is willing to move to the state in which he is bringing suit he cannot be punished for contempt of the injunction, and its efficacy is dependent upon whether it will be recognized as a reason for dismissing the action by the law court in the other state.

Raising points of constitutional law and seeking injunctions against exporting suits are clumsy expedients calculated to prevent only the most obviously vexatious choice of forum by a plaintiff. Defendants were forced to resort to them by the general failure of state courts to entertain a motion to dismiss on the ground that some other forum would be more convenient. The plea of *forum non conveniens* is allowed in civil law countries and also in England; and American courts have reached a similar result on a slightly different theory in cases where the plaintiff is a foreigner, holding that under such circumstances it is a matter of discretion whether

or not they will permit him to sue. But in the case of plaintiffs who are citizens of sister states they have allowed suit on transitory actions wherever there was jurisdiction. This is in part a mechanical application of common law rules of venue and in part due to a theory of constitutional law which the Supreme Court of the United States has recently held to be without any foundation. The theory was that the privilege of suit was a privilege of citizenship guaranteed to the citizens of the several states and that no distinction could be made between a resident plaintiff suing at his home and a non-resident plaintiff suing far from home merely to make things difficult for the defendant. It remains to be seen whether exploding this notion of a constitutional requirement will result in leaving the state of trial largely to the discretion of the court where the plaintiff has begun his action, as in the case of related problems concerning the county or nation of trial. At least one state court has continued the old mechanical approach.

In criminal procedure one meets again the familiar concepts of venue and jurisdiction, but the problems of place of trial, its setting and its history are each quite different. As in civil actions, the early common law requirement that jurors know the facts made necessarily for trial in the locality of the crime. But this did not disappear with the development of the modern form of jury trial as readily as it did in civil actions. Both the peculiar interest of the immediate community in "seeing justice done" and the traditional reluctance to deprive the accused of any ancient advantage tended to keep criminal actions local. No convenient fiction enabled the prosecutor to allege that a crime was committed at A to wit at B. On the contrary, the accused could escape, no matter how clear the proof that he had committed a crime, if he could raise a reasonable doubt as to whether it was committed in the particular county where he was being tried. Quibbles could arise if a shot was fired, a libel sent or stolen goods taken across a boundary line or if principals acted in one place and accessories in another. An extreme illustration is the early holding that if a wound was inflicted in one county and the victim died in another there could not be trial anywhere.

Escape from the extremely local basis for criminal prosecution was found in the fiction of "continuous crime," which assumed that a new theft was committed when the stolen goods were carried into another county; and in a long series of specific statutes permitting trial in either

county of crimes committed partly in one and partly in another and permitting trial of certain crimes in any county, of others where the accused was apprehended and still others before certain courts. The culmination of the development is the English Criminal Justice Act of 1925, which adopts substantially the same practise as in civil actions. Subject to change on grounds of convenience, trial may take place in any county in which the accused is apprehended, is in custody or appears. Legislation in the United States has followed the earlier English statutes removing the most serious difficulties caused by the strict requirement of local venue in the case of particular crimes. It is also possible, where local feeling would prevent a fair trial, for the accused and occasionally the prosecution to obtain a change of venue to some other county, but the usual constitutional guaranties of trial by a jury of the locality have prevented the adoption of as flexible a procedure as is now available in England.

If sweeping enough the legislation expanding the concept as to when a crime has been committed in a county can also take care of the case in which there has been action partly in the county and partly in another state or country. Where acts of treason or counterfeiting are done abroad, special statutes provide for trial in the state prejudiced. There is a peculiar administrative difficulty when the accused is not to be found in the state where the crime was committed. Unlike a civil plaintiff the interested state does not follow the accused about to prosecute where he is found. He can be brought to justice in only three ways: by kidnaping or extradition in order to return him to the state of the crime or by interest in his prosecution on the part of the state in which he is at the time. Interstate extradition is provided for in the federal constitution, but it has been held unavailable where the criminal never enters the state of his crime and therefore cannot be called a fugitive from it. This makes possible a failure of justice, unless his action is also made a crime by the state in which the criminal act is done. Thus in a famous case where a murder was committed in Tennessee by shooting from North Carolina those accused could not be convicted in North Carolina nor could Tennessee have them extradited. As between nations, extradition is a matter of treaty or of occasional acts of courtesy. Extradition treaties are a relatively modern development. The civil law countries ordinarily do not allow extradition of their own nationals but

go quite far in prosecuting them for major crimes committed abroad. Italy even tries foreigners for major crimes committed outside the country if prejudicial to its nationals. England now punishes Englishmen for commission abroad of such crimes as murder, manslaughter and bigamy. But American law still clings tenaciously to the old common law theory that only the state where the crime is committed has jurisdiction.

How far a state should go in dealing with crimes committed abroad depends in part on the alternative possibility of turning the accused over to another state interested in prosecuting him, in part on prevailing conceptions of the object of the criminal law—to what extent the state is seeking vengeance, to what extent it is attempting to deal with its criminal population. Assuming that there is a recognized interest in preventing a particular accused from escaping trial, it must be balanced against the desire to have all possible safeguards against unjust convictions. Discussion of the problem as a matter of jurisdiction is only another illustration of the use of this concept as an impressive way of begging a difficult question of degree and making a hastily assumed result seem to follow from inexorable logic.

JURISDICTIONAL DISPUTES. See DUAL UNIONISM.

JURISPRUDENCE. In the widest sense of the term jurisprudence is the science of law. This is the original and etymological meaning and the one to which the best usage conforms. But there are three other uses. In the narrower sense commonly employed by English writers jurisprudence might be called the comparative anatomy of developed systems of law. This narrower conception became current in English speaking countries through Austin's *Province of Jurisprudence Determined* (London 1832), an epoch making book written exclusively from the analytical standpoint. In French usage jurisprudence means the course of decision in the courts,

and this sense has been fixed in good American usage by the classical work of Judge Story on *Equity Jurisprudence* (3 vols., 14th ed. Boston 1918), which traced the course of decision in Anglo-American courts of equity. By a not unnatural transition the word has also come to be used, chiefly in the United States, as a polysyllabic synonym for law itself. It might be best to speak of jurisprudence as the science of the legal order or of the legal ordering of society, including the legal process and also the institutions and the body of authoritative legal materials by which it is carried on. For the word law is used both of the legal order and of the means by which it is brought about. Thus "respect for law" means respect for the legal order but "the Roman law" means the body of authoritative legal materials with which the Romans administered justice and maintained the legal order. Thus jurisprudence is concerned both with the task of the legal order, namely, social control through the legal ordering of human relations in politically organized society, and with the means, namely, legal institutions and law.

The methods and preconceptions of juristic study have shifted with the large changes in intellectual attitudes. In the seventeenth and eighteenth centuries men thought of the different bodies of organized knowledge of social phenomena as philosophy, in the nineteenth century as history and in the twentieth century as science. These changes often mean little more than that the rise of some new branch of learning or some new intellectual interest leads scholars in every field to rephrase the teaching of the past in terms of it. When the philosophical method was dominant jurisprudence was called a philosophy; when a historical method prevailed it was thought of as history; and under the reign of positivism and sociological method it has been considered a science.

In general analytical jurists have thought of jurisprudence as concerned with the mass of authoritative precepts by which justice is administered in a developed political society. Historical jurists have conceived of all social control as within their province. Philosophical jurists have tended to think of legal precepts as a specialized type of moral precept and so have been led into the whole domain of valuation and regulation of conduct. Sociological jurists have thought of a process and of the authoritative materials of administering justice as something to be treated and appraised with

reference to that process. Much of this divergence of view as to the scope of jurisprudence results from difference in the problems to which these jurists have been addressing themselves. Analytical jurists have in the main written under conditions of economic and political (and hence legal) stability, when there was little or no occasion to draw on materials outside of the authoritative tradition. Hence it seemed to them that all that the jurist might reasonably require was to be found within the confines of current legislation, doctrine and judicial decision. Historical jurists have sought to replace authority and reason by history as an unchallengeable basis for what goes on in the legal ordering of society. Hence they have drawn upon all the phenomena of social control in the evolution of the legal order. Philosophical jurists have flourished chiefly in times of legal growth and so have been concerned most with the sources upon which courts and jurists draw to enrich the authoritative legal materials. Sociological jurists looking at law functionally have been more interested in what law does and how it does it than in what it is and so have looked primarily at the legal order. A complete science of law requires for its different purposes all of these starting points and resulting methods. It calls for a grasp of the authoritative materials of administering justice as they are and as they have been, of the problems of social control for which they have grown up or have been devised and of the extent to which the materials and their application do or can meet the problems.

Historical jurists in discussing the nature of law commonly include under it the whole of social control. The analytical jurists limit it to a specialized form of social control through the administration of justice—the adjustment of human relations and constraining of behavior to the demands of social life by the authority of the state. In this sense we may say that law as a specialized form of social control, such as we know it in developed political societies, begins with lawyers. It begins when the traditional conduct of transactions, decision of causes and procedure of advising parties to controversies become secularized and pass into the hands of a specialized profession. At Rome a turning point was reached when the traditional formulae of actions were made public and when a little later the first plebeian pontifex maximus began to give consultations in public. But Roman law became significant as a legal system

only with the rise of the professional jurists—consults at the end of the republic. Modern law had its beginnings when Roman law became the rival of the law of the church and then set itself free from clerical control; and the modern science of law began when jurisprudence was emancipated from theology. In English legal history the supremacy of the king's courts—the source of the common law—may be dated from the Constitutions of Clarendon (1164), which put definite and narrow limits to the jurisdiction of the ecclesiastical courts. The history of American law in the original thirteen states began when the administration of justice came into the hands of professional lawyers after a regime of justice carried on chiefly through clerical and military magistrates.

In the strictest sense the scientific treatment of law may be said to have begun when lawyers or law writers first distinguished cases superficially analogous and sought a principle behind the distinctions. Thus the beginnings of juristic science at Rome took the form of distinguishing cases which came within a precept of the codified customary law from those which did not, where both might seem to. This method is reproduced in the "putting of differences" and "taking of diversities" so characteristic of the common law until the seventeenth century. The next step, after having compared cases and thus compared rules in a particular system, was to compare rules of different systems by analysis. Such a step was taken in Roman law in the later republic. But even before these beginnings the foundations of a science of law were laid in philosophy, and here as in almost every sphere of mental activity the beginning must be made with Greek philosophy.

In classical Greece law in the lawyer's sense was not fully or clearly differentiated from other agencies of social control. The Greek word *nomos*, which we translate "law," was a word of many meanings, among them ethical custom, religious rites, law in general in the lawyer's sense, a rule of law and social control as a whole. While the Greek city-state must be considered politically organized, it was very close to and in many ways in transition from a kin organized society. Indeed if Greek law is in form political, it is in substance very largely tribal. Greek philosophers, observing the contest between the kindreds and the kinless and the competition between the traditional tribal law and the enacted law of the city-state, sought

to find some assured basis of social control other than tradition and habit of obedience, on the one hand, or the will of the politically supreme body, on the other hand. They were thus led to consider the great diversity of ethical customs and laws, both as between Greeks and "barbarians" and as between the Greek cities. Not only were no two cities alike in these respects, but the same city often had different rules of law on the same subject at different times. Thus from one standpoint it seemed that the legal order was a mere matter of enactment or convention and was subject to the arbitrary control of anyone wielding political power for the time being. But since contests of oligarchy and democracy for political supremacy were the staple of life in the classical Greek city, there was a real menace to the general security in a conception of the legal order as a product of arbitrary individual will. Philosophers sought a more assured basis of social control and found it in the analogy of the constant and universal phenomena of physical nature. They conceived the legal order as an organizing of human activities so as to keep each man in his appointed place in the politically organized society of an ideal Greek city. They held that right and law had their basis in a harmony or fitness involved in the nature, that is the ideal, of things. Right and law were taken to be independent of human will and to have universal validity.

Roman lawyers carried these ideas from political philosophy over into law. Where the Greek philosophers wrote on natural right, that is, the just or the right by nature or ideal, the Roman jurists spoke of natural law, that is, a speculative body of universal ideal principles involved in the ideal of things. This universal body of ideal principles served as the basis of lawmaking, of juristic development of legal materials, and of criticism. The classical period of Roman law is marked by the attempt to make the actual law conform so far as possible to this ideal standard. Natural law substituted a philosophical juristic technique for the traditional art of the lawyers of the republic.

Law was one of the chief subjects of study in the mediaeval universities, and the twelfth century represents a new start in juristic thought. From that time juristic development runs along two lines—legal and philosophical. In the one there is a gradual development of scientific treatment of the texts of the Roman law; in the other there is speculation as to the basis of

the authority of law and ethical justification of its precepts and doctrines. Behind the purely legal development was the academic juristic theory of the continuity of the empire. In some sort this was an ideal. For spiritual purposes Christendom was the church; for temporal purposes it was the empire. The practical law teaching of the Middle Ages assumed that the ideal or postulated empire was the empire of Augustus and Constantine and Justinian. Only in this way could a legal mind satisfy itself that the text of the *Corpus juris* was authoritative legislation binding upon "the empire" and hence upon all Christendom. From the simple method of the glossators (twelfth and thirteenth centuries), who took up the text bit by bit and interpreted it, there grew up from the thirteenth to the latter part of the fifteenth century among the commentators a highly complicated method of exposition based upon formal logic and the scholastic philosophy. System was put into subjects and departments of the law where the glossators had confined themselves to particular texts. Among practical lawyers the method of the commentators continued to the seventeenth century but the science of law was carried forward in the meantime by a new school of jurists. At the end of the fifteenth century the revival of learning, the influence of philosophical thinking and in particular humanist study led to the school of humanists, who made a scientific study of the law as a whole as distinguished from the study of the texts and titles of the *Corpus juris*. The outstanding jurists in this school were Cujas (1522–90), the pioneer of legal history, and Donellus (Doneau) (1527–91), the pioneer of systematic analytical exposition of the law as a whole.

As a philosophical discipline jurisprudence grew up as an important branch of theology. Philosophers began to consider the philosophical-theological bases of right and of the binding force of law. While the primitive idea of the end of law as a mere keeping of the peace had come back for a time with Germanic law, the study of the Roman texts and the familiarity of the mediaeval theologians with Aristotle restored the Greek conception of law as an orderly maintenance of the social status quo. Law was conceived as a system of precepts imposed by authority or by custom to maintain a stationary society as it was.

In general it may be said that the thirteenth century put philosophy behind law to sustain authority. From the thirteenth to the seven-

teenth century jurisprudence was held to be an application of theology. The sixteenth and seventeenth centuries divorced the philosophy of law from theology and divorced law from authority. In the seventeenth and eighteenth centuries what would now be thought of as treatises on jurisprudence were treatises on the law of nature and nations. That is, a general philosophical introduction sufficed as the basis of jurisprudence, politics and international law. The institutions and functions of government, the relations of individuals with each other and with the state and the relations of states with each other were the subject matter of one body of knowledge. The nineteenth century divorced legal philosophy from political philosophy and definitely set off jurisprudence as a separate science. The twentieth century seeks to unite jurisprudence with the other social sciences through some form of social philosophy.

After the Reformation the two lines of development in jurisprudence, the practical and the philosophical, converge. The authoritative basis of practical exposition and the authoritative basis of philosophical speculation had alike failed. The academic doctrine of the continuity of the empire and the consequent binding force of the Roman law books were given up, and law was emancipated from the text of Justinian. Likewise the Protestant jurist theologians of the north of Europe had not hesitated to declare that there was a sufficient basis for natural law apart from the Scriptures or even, as Grotius put it, that natural law could be conceived even if there were no God. For a time the science of law and the authority of legal precepts were based solely upon reason: jurists believed that a complete and perfect system of legal precepts could be built up upon principles of natural law discoverable by reason and derived from the ideal of the abstract man. Thus the seventeenth and eighteenth centuries are in many respects comparable to the classical era of Roman law. The fields of jurisprudence and of ethics were taken to be the same. It was sought to make law coincident with morals. Legal precepts were made to conform to what each particular writer thought on ethical grounds they should be. An era of creative lawmaking resulted, the influence of which is still felt in law and in the science of law.

In the nineteenth century certain lines of cleavage, involved in divergent aspects of eighteenth century philosophical jurisprudence, and different phases of reaction from the law

of nature school brought about a separation of jurists into three well defined schools—the historical, the metaphysical and the analytical. The influence of an age of absolute governments, of which the French monarchy of the old regime represented the type, revived the conception of law as enactment; a doctrine of authoritative legislative declaration of reason which alone had ultimate authority no longer proved satisfying. Moreover the philosophy of Kant had undermined the method of eighteenth century jurisprudence. For a time the place held by theology in the Middle Ages and occupied by reason in the seventeenth and eighteenth centuries was usurped by history.

Although there were important forerunners, historical jurisprudence was founded by Friedrich Karl von Savigny (1779–1861). His method was philosophical and historical and his continental followers are frequently called the German historical school in distinction from the English historical school founded by Sir Henry Maine (1822–88). Maine was in a very real sense a follower of Savigny, but his method was comparative and historical and was much influenced by analytical jurisprudence, as the method of the German historical school was influenced by the contemporary metaphysical jurisprudence of the continent. Historical jurisprudence came to prevail generally in continental Europe and in the United States in the last third of the nineteenth century. Philosophically the historical jurists were Hegelians. They urged some form of idealistic interpretation of legal history, usually an ethical idealistic interpretation in which the history of law was thought of as a record of the realizing or unfolding of an idea of right or a political idealistic interpretation in which it was regarded as a realizing or unfolding of the idea of freedom. They carried forward the doctrine of those eighteenth century jurists who held legislation and precepts of positive law merely declaratory. The natural law jurists said they were declaratory of reason. The historical jurists said they were declaratory of the social experience in the administration of justice in which an idea of right or an idea of freedom was unfolding. In consequence they regarded law as something which could not be made consciously. They regarded custom as the typical growing point of law and found the basis of observance of law in the social pressures behind legal precepts, while analytical jurists found it in sanctions imposed by the state.

Philosophical jurisprudence was carried on in the nineteenth century by the metaphysical school, which was especially strong in Italy and in Scotland. This school sought to work out an ideal critique of legal institutions, legal doctrines and legal precepts, deduced from a fundamental idea of right or some single fundamental formula of justice. Where the law of nature school thought of an ideal body of legal precepts, the metaphysical jurists thought rather of an ideal element in the law and a critique of legal precepts on the basis of that element. Conceiving the ideal element as the significant part of the law, they held with the historical jurists that law is found not made. Also they rejected the analytical conception of sanction, thinking rather of the ethical and moral bases of legal precepts. In England and the United States it has been customary to speak lightly of this school and to assume that their speculations were wholly in the air. It is true that they did not directly and immediately affect the actual course of judicial decision and juristic writing. But through their influence upon the historical school they fixed the lines of the ethical interpretation of legal history and gave content to the idea of freedom which historical jurists postulate as unfolding in legal development. Maine's famous generalization that the history of law is the record of a progress from status to contract simply puts in concrete form the cardinal idea of the metaphysical school.

Another trend in eighteenth century theory, which had conceived of an authoritative declaration of natural law by the sovereign, was carried forward in the nineteenth century by the analytical school. Its founder, John Austin (1790-1859), was a disciple of Bentham and a zealous utilitarian. In form this school broke wholly with philosophy. It conceived law as an aggregate of rules and considered that when it had defined a law it had thereby defined law. It sought to take the authoritative precepts of developed systems of law as they were and to analyze legal institutions and legal conceptions as they actually obtained, and in that way to reach a universal science of law. So far as they considered the content of law at all, they looked at it from a utilitarian standpoint. But they considered the materials given and shaped by utility as put in legal form by a lawmaker analogous to Hobbes' absolute monarch. They regarded law therefore as something made consciously by lawmakers and held that rules of

law derived their authority from the force and constraint behind them. They held that no rule could be said to be a law unless it had behind it the judicial organs of the state. To them a statute as a legal precept deliberately established by the sovereign was the typical form of law. If we think of law as made up of three elements, a body of precepts, a received technique and a body of received ideals, we may say that analytical jurists looked exclusively at the first of these elements. They were concerned only with what one of them has called "the pure fact of law," excluding all consideration of ideals. They postulated a body of legal precepts made at one stroke on a logical plan to which those precepts conformed in every detail and set out to discover that plan by analysis.

Metaphysical jurisprudence to some extent worked out a critique of law from the outside. But analytical jurisprudence and historical jurisprudence simply set up a critique of the particular body of law in terms of itself. They served well for the period of economic, political and legal stability in the latter half of the nineteenth century. But toward the end of the century it came to be felt that the science of law was behind the actual administration of justice. It was serving to retard growth and resist the pressure of new interests seeking legal recognition and security. Analytical jurisprudence had culminated in what has been called "the jurisprudence of conceptions." A certain number of authoritative starting points for legal reasoning and a certain number of authoritative categories into which the facts of particular cases were to be forced by legal reasoning were regarded as sufficient for the decision of every conceivable case. New situations of fact could do no more than call for logical application of the authoritative principles or logical classification in the established categories. Any new situation was to be met by deduction from a fixed traditional conception. The alternative was legislative establishment of a new precept. But when legal precepts were thought of as mere commands of the sovereign there was no guaranty that the rules prescribed would comport with the demands of reason, as would be called for by the social-philosophical jurisprudence of today. Likewise historical jurists took the conceptions of the traditional law for necessary fundamental conceptions of all law. They insisted that all legislation or restatement must run along idealized

traditional lines. Even the accidents of legal history were likely to be insisted upon as necessary principles or necessary categories. Accordingly toward the end of the nineteenth century the three schools began to dissolve. Sometimes they made concessions to each other, as, for instance, in continental Europe, where the historical method and the metaphysical method came to be regarded as complementary. The metaphysical school definitely disappeared by the beginning of the twentieth century. The historical school and the analytical school still have adherents, but both have been largely superseded by new types of juristic thought.

In general the development of jurisprudence in the twentieth century has taken two directions, one philosophical, the other sociological. In the one line we find a revived philosophy of law giving rise to a social philosophical jurisprudence. In the other functional study of legal institutions in the light of all the social sciences and a conception of the legal order as a social institution have replaced exclusive consideration of the authoritative materials with which justice is administered. Social philosophical jurisprudence began in the last quarter of the nineteenth century with the social utilitarianism of Rudolf von Jhering (1818-92). His method might be said to be analytical and social philosophical. He insisted particularly upon the end, or purpose, of law, analyzing the law of the time and place in order to reach principles and general conceptions, but subjecting them to a critique with reference to the end which law subserves. His great achievement was in turning attention from the nature of law to its purpose, insisting on the interests which the legal system secures rather than upon the conceptual apparatus by which it secures them. His theory of rights, in the sense of analytical jurisprudence, as means whereby interests are secured, taking the claims or desires of human beings as ends which the legal order seeks to satisfy, and his rejection of the jurisprudence of conceptions because it ignored these ends are enduring achievements of legal science.

Somewhat later social philosophical jurisprudence was carried forward by the neo-Kantians, who have been the most influential group in that trend in the present century. Their founder and leader, Rudolf Stammler (1856-), carried forward the philosophical side of nineteenth century jurisprudence. His method might not unfairly be characterized as philosophical and

sociological. Stammler's main purpose was to work out a universally valid method of judging as to the justice attained by legal precepts in the time and place. As contrasted with the eighteenth century conception of universally valid ideal precepts and also with Kant's essay at a universal critique, Stammler sought rather a universally valid method of developing a relative critique whereby justice might be achieved in the time and place. He brought back into jurisprudence what the French call *juridical idealism*; that is, the search for ideals to which law ought to conform. His great work has been in giving definite outline to the ideal of the legal order and the ideal of the end of law by which jurists and judges are governed in finding and developing and applying legal precepts. His enduring achievements for jurisprudence lie in the formulation of the social ideal of the time and place, thus directing attention to the ideal element in law which the analytical jurists had rejected, and in a theory of the application of legal precepts where the last century thought simply of their nature. Nineteenth century philosophical jurisprudence asked whether a particular legal precept was just. Stammler asks whether and how far justice may be attained by means of the precept. Where the nineteenth century considered that if rules were abstractly just the results of the application of the rules in particular cases need not be looked into, he has taught the present century to seek just results by means of legal precepts conforming to and administered in the light of social ideals.

A third type of social philosophical jurisprudence is represented by Josef Kohler (1849-1919), the leader of the neo-Hegelians. His method was historical and social philosophical, carrying forward the historical jurisprudence of the last century. Like the historical school he recognized limitations on the efficacy of effort to improve the law, in that any culture must shape the legal materials which have come down to it and is limited by those materials; but he thought of historical continuity as a practical condition rather than as a necessity. He recognized that law while it must be stable must nevertheless also change. He thought of law as a product of the civilization of a people in the past and of attempts to adjust the results of that past civilization to the civilization of the present. The adjustment must be made with reference to the fact of a continually changing civilization, and the traditional legal materials must be shaped so as to further rather than

retard the developing culture. His most important contribution is his theory of the jural postulates of the civilization of the time and place. He considers it the task of the jurist to discover and formulate the principles of right assumed by or expressed by a given civilization. Not only may these jural postulates serve as a critique of legal precepts, but, even more, received ideals may be tried with reference to them; and definiteness and clear outline may thus be given to the ideal of the legal order which is so large an element, even if an unconscious one, in the development and application of legal precepts.

In France social philosophical jurisprudence has shown three types of thought: an adaptation and broadening of neo-Kantianism; a neoscholastic philosophy of law seeking a firmer grasp of that element of law which consists of traditional views as to the end of law and traditional ideals of the legal and social order; and a positivist sociological philosophy of law having many affinities with mechanical sociology. The neoscholastic and positivist sociological types are particularly important. The leader of the former, François Geny (1861-), has made a notable contribution to the science of law in pointing out the importance of the element of technique, of which more will be said presently. The leader of the latter, Léon Duguit (1859-1928), deduced a positivist natural law from a principle of social interdependence through a similarity of interest and a division of labor which were taken to be observed and verified social facts. His theory is of some importance in connection with the problem of values to be spoken of in another connection.

Historical jurisprudence was modified in another way by Sir Paul Vinogradoff (1854-1925). Where the historical school saw in the history of law the unfolding of a single idea, he saw a succession of ideas, giving rise to a succession of types—the origins of law in totemistic society, tribal law, civic law or the law of the city-state, mediaeval law as a combination of canon and feudal law, individualist law and the beginnings of socialist law. The central point of his doctrine was his contention that historical types are the foundation of a theory of law.

More recently there has been a tendency in Germany to merge the formerly distinct types of social philosophical jurisprudence in what might be called a neo-idealism which seeks to understand, to organize and to criticize the ideal

element in law. Particularly this school seeks to transcend nineteenth century individualism and nineteenth century orthodox socialism by a conception which shall measure neither community values and civilization values in terms of personality values nor personality values and civilization values in terms of community values but shall conceive civilization as the end toward which both a maximum of free individual self-assertion and an efficient social organization are but means.

A sociological school is still to some extent formative. The development of sociology has been too recent and too rapid to serve as the basis of a school with a well defined creed and fixed program. Moreover definiteness in such matters was in the spirit of the last century more than of the present. But in a general way it may be said of the sociological jurists as compared with the nineteenth century schools that they are concerned not so much with the content of a body of law as with its working. They think of it not as necessarily made or necessarily found but as a social institution which may be improved by conscious effort, whether its content is made or found or both. They urge as the basis of its authority the social ends which law serves. They do not think of either custom or statute as necessarily the type of a law but regard the form of legal precepts as but means to ends which are of more importance. Chiefly they are positivists or neorealists but their pragmatist method, as has often been pointed out, is consistent with more than one metaphysical doctrine.

Sociological jurisprudence has gone through three stages and may be said now to be in a fourth. The first positivist philosophies of law were mechanical positivist and gave this color to the first sociological jurisprudence. Indeed the first sociological jurists did little more than put positivist philosophy behind the nineteenth century historical jurisprudence. Where the historical jurists had found a historico-metaphysical principle behind the development of law, they found physical laws. But the result was the same. Juristic and legislative creative activity were alike futile. Men might observe the inevitable operation of social laws but they could not affect it. The second stage represented a biological approach to law. It was partly the old mechanical sociology of law with a biological vocabulary. Partly also it used biological analogies to work out a sort of embryology of law, relying upon study of the social and legal

institutions of primitive peoples to point out the laws of legal development. In another form it used some biological principle as a basis for a philosophical system, as, for example, in the relationship of the biological struggle for existence to the theories of law as a product of class struggle. The psychological stage, which followed, was of more significance and is still represented in current juristic writing. It has brought about study of the world view of judges, doctrinal writers and lawmakers.

About the beginning of the present century sociological jurisprudence entered what may be called the stage of unification. While the nineteenth century schools sought to construct a science of law solely in terms of and on the basis of the law itself and in effect to set up a critique of the law of the time and place in terms of that law, it is now recognized that this complete separation of jurisprudence from the other social sciences is unnecessary and unhappy in its results. In the nineteenth century the problems of jurisprudence were not appreciated by the related social sciences, and the achievements of the latter, on the other hand, were likely to be ignored by the jurist. A gulf developed between legal thought and popular thought which was very marked at the beginning of the present century. The backwardness of legal institutions in fulfilling social ends and the reluctance of lawyers to permit or even perceive such ends are in large part chargeable to the science of law as it existed in the nineteenth century. In the present stage of unification the sociological jurists recognize that each of the directions which jurisprudence has taken offers something to the science as a whole but is not to be pursued exclusively. Even more they recognize the futility of a detached, self-centered, self-sufficient jurisprudence. Beginning with the proposition that the legal order is a phase of social control and to be understood must be taken in its setting among social phenomena, they urge study of the actual social effects of legal institutions and legal doctrines; sociological study in preparation for lawmaking; study of the means of making legal precepts effective in action; study of the actual methods of juristic thinking, judicial decision and legislative lawmaking; a sociological legal history in which the social background and social effects of legal precepts, legal doctrines and legal institutions in the past shall be investigated; and above all study of how these effects have been brought about.

In the immediate present juristic thinking as a whole appears to be running in two channels. On the one hand, there is criticism of ideals and attempt to organize, systematize and give definiteness to those received ideals that must be considered a part of the authoritative legal materials. On the other hand, there is an increasingly manifest tendency to revert to the frame of mind of the analytical jurists and exclude everything but the positive legal precept from the conception of law and the province of jurisprudence. A group of jurists in continental Europe seek a "pure juridical science" by excluding all ideals of interpretation and of application, conceiving that by throwing out everything which gives life to the law they can impart "clarity and rigor" to its phenomena. Other jurists move in the same direction by assuming the law to be a normative science differing from other bodies of knowledge in that it starts with postulates where others start with observation. Accordingly a theory of sovereignty and a legal logic assuming the constitution to be a fundamental and unchallengeable basis are thought to produce a pure science of law divorced from all subjective speculation; the postulates being settled, everything will flow from them with the inevitableness of a mathematical demonstration. The leader in this tendency is Hans Kelsen (1881-). No doubt such a universal science is possible, but it is achieved by ridding the law of all the doubts and difficulties which make a science of law worth having.

Another phase of this movement for objectivity may be seen in a group of new realists in America. This school is still formative and cannot be said to have any detailed or official creed. But five items to be observed very generally in the writings of those who may fairly be grouped in this school are significant. In general these jurists have faith in the significance of statistics. They seek objectivity by some one method or line of approach which is considered to have exclusive reality. One of these lines of approach is rigid terminology; another, already spoken of, is the theory of a normative science depending upon postulates assumed as unchallengeable starting points; another is observation of the phenomena of administration of justice carried on objectively and scientifically and is expected to yield formulae as rigidly exact and free from any personal or subjective element, whether in formulation or application, as, for example, those employed by the engineer. Many assert

that the sole valid approach is by way of psychology and it is commonly assumed that some one psychological starting point is inevitably to be chosen. Still another characteristic is insistence on the unique single case rather than on the approximation to a uniform course of judicial behavior. Radical neorealism seems to deny that there are any rules, principles, conceptions or doctrines, because all judicial action, or at times much judicial action, cannot be referred to them, because there is no definite determination whereby we may be absolutely assured that judicial action will proceed on the basis of one rather than another of two competing principles and because concrete cases not infrequently fall into a no man's land which lies between most legal conceptions. Since much takes place in the course of adjudication which does not fit exactly into the doctrinal plan, it is assumed that the principles, the conception and the plan are without reality. Finally, many of the new realists think of law as a body of devices for the purposes of the transaction of business instead of as a body of means toward general social ends, thus putting the whole emphasis on the exigencies of the economic order where the nineteenth century put the whole emphasis on the general security of the economic order.

Much that is likely to prove valuable for jurisprudence is involved in these recent tendencies. But it should be borne in mind that jurisprudence must consider not merely how judges do decide but how they ought to decide to give effect to the purposes of the legal order, not only how the judicial process actually takes place but how it should go forward. Psychology may be of aid in clarifying the manner in which justice is administered but this cannot dispense with the question of how justice ought to be administered. This question of ought turning ultimately on the theory of values is the most difficult one in jurisprudence. Those who long for an exact science analogous to mathematics, physics or astronomy are inclined to seek exactness by excluding this problem from jurisprudence altogether. But such a jurisprudence has only an illusion of reality; the significant question is the one excluded.

In the nineteenth century metaphysical jurists often argued that jurisprudence must stand still until all had agreed on the metaphysical fundamentals without which there could be no juristic superstructure. The legal science of that time succeeded nevertheless in reaching an agree-

ment as to the end of law and in formulating a criterion of values from each of the many diverse metaphysical starting points of the time. Likewise ethical philosophers have been wont to urge that there could be no accepted measure of valuing interests for legal purposes until we were all agreed on the highest good. But jurists have not awaited the outcome of debates on this fundamental point. In the last century they succeeded in coming to certain general ideas from each of the different ethical standpoints and found that they served well enough for the legal science of the time. It would seem therefore that jurisprudence need not choose definitely and decisively from among the competing psychologies of today and commit itself irrevocably to one of them, nor need it wait for psychologists to agree, if that is ever likely to happen. It ought to be able, from whichever of the important current psychologies it starts, to reach a sufficient psychological basis for juristic purposes. As to the denial of reality to rules, principles, conceptions and doctrines, such a view is not unnatural as a protest against the assumption of the analytical school that law is nothing but a simple aggregate of rules. But it is equally unreal—that is, at variance with what is significant for a highly specialized form of social control through politically organized society—to conceive the administration of justice or the legal adjustment of relations or even the working out of devices for the more efficient functioning of business in a legally organized society, as a mere aggregate of single determinations.

In the nineteenth century jurisprudence was chiefly concerned with three questions: the nature of law, the relation of law and morals and the interpretation of legal history. Juristic discussion of the nature of law was largely futile because it did not connect the question of what law is and the attendant controversy as to the relative claims of the common law and legislation to the name with other problems of jurisprudence. The significance of the question of what law is can be brought out only when it is considered in connection with the equally old problem of law and morals, with the distinction between law and equity, with the discussion of the province of court and of jury, with the controversy as to fixed rule or wide discretion in procedure, with the movement for the individualization of punishment and with the continental controversy over the application

of legal rules. The question of the nature of law must be brought into relation with these questions as to a considerable extent forming with them the larger problem of rule and of discretion in the administration of justice, and that problem goes back to an ultimate one of a balance between the general security and the individual life. A developed body of legal precepts is made up of two elements, an enacted, or imperative, element and a traditional, or habitual, element. There is a constant movement back and forth between these two. The traditional becomes formulated in legislation and becomes imperative. The imperative becomes overgrown by a judicial gloss and is incorporated presently in the common law. But the traditional element comes to rest upon juristic science and the habitual modes of thought of a learned profession; thus the basis of its authority seems to be reason and conformity to ideals of right. On the other hand, the imperative element rests upon the authority of the state and is easily taken for a product of the sovereign will. In consequence of these two elements of developed bodies of law and of the different bases upon which their authority rests two distinct ideas of law are to be found throughout the history of jurisprudence, and definitions of law have oscillated between these two ideas according to the circumstances of legal systems and the agencies through which their precepts have for the time being been expressed.

Much of the discussion as to the nature of law has assumed that jurists were talking about the same thing, whereas analytical jurists had in mind the precept element of law (rules, i.e. precepts attaching a definite detailed legal consequence to a definite detailed state of facts; principles, i.e. authoritative starting points for legal reasoning; conceptions, i.e. carefully defined categories to which, when a given situation of fact is brought within one of them, certain rules, principles and standards attach; and precepts prescribing standards, i.e. certain limits of conduct and authoritative guides to the valuation of conduct to be applied in view of the circumstances of each case), historical jurists had in mind very largely the traditional art of the lawyer's craft (the authoritative traditional technique of finding the grounds of decision in the mass of precepts) and philosophical jurists had in mind the ideal element in law (a body of received ideals of the social order, and so of the legal order, of what law is and what law is for, of what legal precepts ought to

be and how they ought to be applied). Thus nineteenth century jurisprudence expended much of its energies in debating whether some one of the three elements in the authoritative materials of administering justice possessed exclusive significance. Today we may very well give up such discussions. All three elements should be considered and together they constitute the background of juristic writing and judicial decision and are decisive in the choice of starting points for legal reasoning and in the interpretation and application of legal precepts. Analytical jurisprudence overlooked the technique element and indignantly rejected the ideal element. But it is the technique element which is decisive in giving character to each of the two great legal systems of the modern world, the common law and the civil law. There is no uniformity of precepts in the common law world nor in the civil law world, yet English speaking lawyers everywhere understand each other as perfectly as each fails to understand the continental or the Latin American lawyer. Such things as the respective attitude of the common law and the civil law toward statutes and judicial decisions or toward specific relief illustrate the profound influence which technique plays no matter upon what pretext it is exerted.

As to the operation of the ideal element it is significant to compare the way in which Married Women's Acts in the fore part of the nineteenth century were held down as in derogation of the common law with the willingness of courts to go even beyond the letter of statutes in giving effect to laws abrogating or altering rules of the feudal property law. In both cases the statutes were in derogation of the common law. But the doctrine of strict construction of statutes in derogation of the common law was not applied to the laws which overhauled the law of real property and purged it of archaisms. Married Women's Acts, on the other hand, ran counter to an ideal of a society which pictured women as in the home and not about in the world entering into legal transactions. That the one set of statutes conformed to a received ideal and was given the fullest effect, while the other did not and was held down in operation, is not to be explained by the common law canons of interpretation.

In connection with the ideal element in law it is important to note the growth of ideals as to the end of the legal order. The first ideal is a very simple one of keeping the peace.

Greek philosophers later worked out a conception of the legal order as a social institution for maintaining the social status quo. This conception prevailed in antiquity. With the downfall of the Western Empire the ideal of keeping the peace came back for a time, but the later Middle Ages adopted the Greek and Roman ideal of an orderly maintaining of the social status quo. Following the Reformation a new ideal developed which culminated in the nineteenth century and perhaps was best formulated by Kant. It might be defined as an ideal of a maximum of free individual self-assertion as the highest good. Today that ideal is manifestly giving way and the fact that the ideal element in the law is in transition will account for many things upon which the new realists rely to show the futility of the authoritative apparatus of administering justice. Because received ideals are in flux and the line between authoritative ideals and the personal ideals of particular judges is more than usually hazy, law and its application are for the time being much at odds in some important fields of judicial and administrative action. What is most needed is a constructive theory of the neglected element of the law in which the mischief lies. Here is the task to which social philosophical jurisprudence has been addressing itself. A philosophical jurisprudence which will organize and criticize and illumine the element of received ideals, as analytical jurisprudence and historical jurisprudence have done for the precept element, will achieve substantial improvements in the administration of justice.

Juristic attempts to formulate a new ideal of the end of law are taking two directions. On the one hand, there is endeavor to substitute an idea of cooperation in the maintaining and furthering of civilization for the idea of free competitive self-assertion which obtained in the nineteenth century. On the other hand, there are attempts to conceive law in terms of what has been called social engineering, using engineering in the large sense which industrial engineering has made familiar in the United States. In this mode of thinking the legal order is assumed to be part of the process of social ordering, functioning partly by the administration of justice, partly by administrative agencies and partly by providing guides in the form of legal precepts, so that conflicts of interests are avoided or minimized and individuals are kept from collision by having pointed out to them the paths which each is to pursue. The

legal order is taken to be an aggregate of activities—judicial, administrative, legislative and juristic—so far as they are directed to the adjustment of relations, to the compromise of overlapping claims and the securing of interests by fixing lines within which each may be asserted with a minimum of friction and waste, and to the discovery of devices whereby more claims or demands may be satisfied with a sacrifice of fewer. Regarded in this way as one side of the process of social control, the legal order is thought of as a task or a series of tasks in social engineering. It is conceived to be an elimination of friction and a precluding of waste as far as is possible in the satisfaction of unlimited human desires out of a relatively limited store of the goods of existence. Law is taken to be the body of knowledge and experience with the aid of which this phase of social engineering is carried on. The end of law then would be to satisfy all human demands and to secure all interests as nearly as may be with the minimum of friction and of waste so that the means of satisfaction may be made to go as far as possible.

Contemporary discussion as to the relation of law and morals is coming to be merged in a broader consideration of the place of law in the whole process of social control. In a pre-legal stage, that is, a stage preceding lawyer's law, law and morality were undifferentiated. In the first stage of lawyer's law, which might be called the stage of strict law, law and morality were sharply differentiated. The law took no account of precepts or considerations outside the body of legislative materials. In a succeeding stage, which might be called the stage of equity and natural law, law and morals were identified. If for convenience we use morality to denote a body of accepted conduct and morals to mean a theoretical valuation of conduct, the strict law ignores both. On the other hand, the stage of equity and natural law would make both the authoritative legal precept and the accepted body of conduct conform to the standards of rationalist morals. In a succeeding stage, represented by the period of legislation and codification from Diocletian to Justinian and in the modern world by the nineteenth century, law and morals were coordinated or contrasted. Analytical jurists held that morals are a matter for the legislator and law a matter for the jurist. In the present stage of the socialization of law many of the features of the stage of equity and natural law are repeated and there is a revival

of the subordination of jurisprudence to ethics. Morals are regarded as an evaluation of interests and law as a delimitation of interests in accordance with such a valuation. Thus the real problem proves to be one of valuing conflicting or competing interests, which results from the historical realizing or unfolding of an idea in the Hegelian sense. From this standpoint legal history has been regarded as a record of the unfolding of an idea of human experience in adjusting relations and insuring conduct consonant with civilized society. Where the idea has been recorded from an ethical standpoint as an idea of right there has been an ethical interpretation. Where, as with most English and American jurists, it has been recorded from a political standpoint, there has been a political interpretation. Later positivist ideas gave rise to ethnological and biological interpretations. But the most important of these interpretations of legal history has been the attempt to understand the history of law in terms of a single economic idea.

The Marxian method of economic interpretation attracted little attention in jurisprudence until the last decade of the nineteenth century. It passed into American juristic thinking in the era of Rooseveltian progressivism in the first decade of the twentieth century and is still an influential element in American juristic thought. In its earlier form it was an idealistic economic interpretation urged by Hegelians, who regarded the history of law as the unfolding of the economic principle of the satisfaction of the material wants of mankind. In the United States a combination of a mechanical positivism with analytical jurisprudence gave rise to an economic interpretation in which it was urged that all law is made consciously by men who make legal precepts to suit the ends of the dominant social class. Others have urged a realist economic interpretation in which it is conceived that law is concerned with the ends of groups in power for the time being and is determined by economic exigencies. Jurists of this type argue that right and law mean nothing but power; that questions of law are simply questions of power; that those in power generalize their purposes and put them in universal terms and that thus doctrines and principles of law arise. Much that has been written in support of the economic interpretation proceeds on misunderstanding of the legal doctrine of liability for wrongs done by an agent or servant. Much more depends on a misunderstanding of

the development of the law of torts at common law. Much more also has been based on very doubtful arguments as to liability without fault in England and in the United States. No one doubts that economic conditions play a great part in determining the ideals of the time and place and that they influence powerfully the formulation of these ideals. These considerations must be reckoned with in formulating the jural postulates of a given civilization. Thus the influence of the economic situation upon the traditional element of law is clear enough. But this influence is indirect and often remote. Frequently the economic situation behind a doctrine is not the contemporary economic situation but that of the period when the doctrine was formulated. One has only to consider the American law as to business corporations and the persistence with which courts and legislatures, although they operate in the shadow of business enterprise, have decided and passed laws in the spirit of a traditional jealousy of juristic persons, to realize how slowly law yields even to the desires of an economically dominant class.

Three persistent problems recurring in different forms in all stages of legal development may well be termed fundamental in jurisprudence: the problem of rule and discretion; the problem of the valuing of interests; and the limits of effective legal action.

Analytical jurists have assumed an antithesis between law and administration, holding that justice according to law is necessarily judicial justice according to formula ("a government of laws and not of men"). The doctrine of separation of powers, in which the judicial power is carefully segregated from the executive and the legislative, was taken over from political theorists and became a cardinal tenet in the juristic faith of the nineteenth century. The trend today is to recognize that reliance must be placed both upon men and upon rules in any effective fulfilment of the ends of law. The problem is not rigidly to exclude the one or the other but to effect a proper adjustment between judicial justice and administrative justice, and between a judicial justice held down to an application of authoritative legal precepts by an authoritative technique and a necessary measure of individualization to be achieved only by free judicial action. Experience seems to show that in large part rule must be assigned to one portion of the domain of the legal order

and discretion to another. Inheritance and succession, interests in property and the conveyance of it, transactions of commercial law and the creation, incidents and transfer of obligations have always been a fruitful field for effective legislation. On the other hand, legislation has achieved little where adjustments and compromises were to be made not with reference to interests of substance but in the weighing of human conduct and passing upon its moral aspects. Codes and uniform state laws have achieved their purpose in connection with the law of property, the law of inheritance and succession and commercial law. They have achieved little or nothing in the law of torts where indeed continental codes are confined to a few generalizations and the actual working out of the law has been taking place chiefly through judicial decision. No one has attempted seriously to codify the law of torts in the English speaking world nor is any attempt likely to be made to reduce to legislative form the doctrines of equity as to the conduct of fiduciaries. On the other hand, the administrative tribunals which have been set up to individualize the application of law, as well as those which have developed in other legal systems, have to do with cases involving the moral quality of individual conduct or of the conduct of enterprises as distinguished from matters of property and commercial law. Titles to property or the collectibility of the assets of a bank cannot be suffered to depend upon individual ideas of what is right and just. On the other hand, no formulation in advance can take care of the minute variations in individual conduct which make each item unique and require a large margin of application if the results are to be tolerable.

Where the nineteenth century thought of law as existing to give effect to natural rights (qualities of individuals by virtue of which they ought to have certain things or be at liberty to do certain things), jurists since Jhering have thought of recognizing, delimiting and securing interests. It is conceived that a legal system attains its ends by recognizing certain interests, by defining the limits within which these interests shall be recognized legally and given effect through legal precepts and by endeavoring to secure the interests so recognized within the defined limits. For such a theory an interest may be defined as a demand or desire which human beings, either individually or in groups, seek to satisfy and of which therefore the order-

ing of human relations must take account. Conflicts or overlappings of these interests call for an ordering of relations and of conduct if civilized society is to be maintained. The law does not create these interests: so much of a kernel of truth there was in the old idea of a state of nature and in the theory of natural rights. But the law recognizes certain interests, classifies them, defines the extent to which it will give effect to them and devises means for securing these interests when recognized and within the defined limits. At every point in this process recourse must be had to a theory of values. Interests must be recognized in generalized forms admitting of treatment by general formulae. They must be weighed and valued as generalized, taking care that the generalizations do not sacrifice to the interests which call for rule and formula too much of other interests and thus result in friction and waste.

Since Jhering deduction of absolute rules has been increasingly given up and a method of weighing claims or demands with reference to the ends of law has more and more prevailed. Social philosophical jurisprudence has been chiefly concerned with the working out of such a method. Social utilitarians would value interests with respect to social ends, translated as ends of the law, but this assumes that social ends are something given. Neo-Kantians value interests by the social ideal of the time and place. Neo-Hegelians value them by the extent to which their recognition and security make for maintaining or furthering civilization: claims are to be referred to the jural postulates of the civilization of the time and place and to be generalized in terms thereof; then we are to ask whether and how far they promote civilization. These are typical systems of the immediate past. Discussion of this fundamental question still goes on and is likely always to go on. In the meantime the law must have some practical criterion and in fact, under the surface and covered by many theoretical disguises, courts and jurists have weighed and valued conflicting claims by attempting to secure as much as possible of the whole scheme of interests with the least sacrifice. Perhaps the juristic theorist can do no more than make explicit and give precision to the method which has actually obtained. Details must be worked out empirically. Compromises and adjustments must be sought through a process of trial and error. Each legal system has and very likely each will

always have its own solution for many cases of conflicting and overlapping claims. Comparative law must always reckon with a certain impossibility of arriving at an absolute valuation. But the jurist may well aim at all times and in all the compromises and adjustments which are involved in the legal order at giving effect to as much of the whole body of human claims and desires as possible.

As a result of the functional attitude toward law the problem of the scope of legal action has come to be recognized as involving something more than logical or metaphysical limitations. In the nineteenth century it was supposed that certain things were to be dealt with by law because that mode of ordering them could be deduced from a fundamental, metaphysically given datum of free will. Other things were to be left untouched by law because restraint of freedom in those respects did not follow logically from the idea of free will. Contemporary jurisprudence is more likely to ask what are the practical limitations upon the scope of law. It is apparent that there are limitations upon effective legal action but they are taken to be inherent in the nature of our legal machinery and are not attributed to some metaphysically demonstrated or logically imposed barrier. Thus with improved machinery the limits of effective legal action may be extended. None the less, there is much that cannot be done well by means of law and what that is must be ascertained through a theory of values. Where legal interference sacrifices values other means of social control must be relied upon. Here the law can do no more than preserve a social order in which these other means may operate effectively.

It remains to say that there are certain practical problems to which jurists of today are giving much attention. First among these perhaps is improvement in the form of the law, whether by codification of parts of the law or by unofficial restatement, such as that being carried on in the United States under the auspices of the American Law Institute. Another matter of scarcely less importance is the devising of an effective legal apparatus for ascertaining the social facts involved in lawmaking and in the judicial finding, shaping and application of legal precepts. In Europe ministries of justice are important agencies for this purpose. In the United States there is no organized study of the functioning of our legal institutions, the application and enforcement of law, the cases in which and reasons for which it fails to do

justice or to do complete justice, the new situations which arise continually and the means of meeting them. There is no systematic inquiry as to what legislation achieves its purpose and what does not and the reasons underlying both success and failure. There is no expert and intelligent guidance to those who frame and those who administer the laws. Both in England and in the United States ministries of justice or some equivalent institution have been urged. Sooner or later something of the sort will have to be set up in English speaking jurisdictions, as the present system is wasteful and ineffective.

Preventive justice is another subject to which juristic activity must be directed. Something has been done through juvenile courts and administrative agencies of probation and parole. But for the most part what is done by way of preventive justice in the criminal law is achieved through extralegal agencies. On the civil side of the law there has been an increasing development of preventive machinery, but study of the possibilities of preventive justice has only begun. The legal science of tomorrow will have few opportunities more promising than the directing of creative energy toward new methods, new precepts and new machinery for preventive justice.

Finally, there is the problem of individualizing the application of law in a society demanding individualized treatment of many things with respect to which it was not needed in the simpler, rural, agricultural society of the past. Where points of contact between men are relatively few, rules of law may suffice for the exigencies of justice. When the points of contact are enormously multiplied, as in the great city of today, when individual claims conflict and overlap on all sides, it becomes necessary to have fine lines and delicate discriminations, which are not easily made by means of rules of law. The demand for individualization has brought about a multiplication of administrative boards and tribunals in the United States and a constantly increasing resort to administrative action in Great Britain. The legal science of the past ignored everything but mechanical logical application of rigidly defined precepts. Today jurists recognize an administrative element in the legal order. It is recognized that in many fields individualization of the application of legal precepts is quite as important as the precepts themselves.

JURY

ENGLAND AND THE UNITED STATES. Trial by jury is the characteristic mode of determining issues of fact at common law and hence in actions at law in those countries where English law prevails or is the basis of the legal system. A common law court could pronounce judgment only upon the pleadings (the statements of their case by the respective parties) or the verdict of a jury determining an issue raised by the pleadings. Hence the pleadings were directed toward framing an issue to be tried by a jury and the trial procedure and law of evidence were shaped by the exigencies of that process. Along with the doctrine of precedents and the doctrine of the supremacy of the law trial by jury is one of the characteristic legal institutions of the English speaking world.

A jury is described by Maitland as a body of neighbors summoned by a public officer to answer questions upon oath. Historically this is quite true. It is precisely these characteristics, summons by a public officer, answering some question or questions put to them by a public officer and answering upon oath, which are common to a grand jury, a petit jury, a coroner's jury, a jury in condemnation proceedings or a jury in inquest of office found. If these different types of jury hear evidence and make presentments or find indictments or hear evidence

and try issues or pronounce as to the cause of death or view and value land or determine the alien character of one who is found holding land, yet they have developed functions of hearing and trying as incidental to the primary one of answering questions put to them. In origin the jury was an administrative device. It came to be used chiefly in the courts but is still not wholly confined to the courts, as some of the above cases suffice to show.

When jury trial as a characteristic institution of English law had come to be regarded as a bulwark of liberty, standing between politically organized society and the individual citizen and securing the latter against oppression, it was sought to trace the jury to the Anglo-Saxon period. In the time of uncritical history it was attributed to Alfred, who had nothing to do with it. Later its origin was sought in the doomsmen of the old local courts or in the compurgators. Also a somewhat analogous institution in Scandinavian law was taken to be the original during the enthusiasm for Germanic law in the last century. More especially after the contests between courts and crown in the seventeenth century two famous phrases in Magna Carta were taken to guarantee jury trial to the ordinary Englishman. But as it stands in the great charter the phrase "law of the land" includes all the modes of trial then usual. It has no particular reference to jury trial. Moreover the phrase "lawful judgment of his peers" has no reference to the jury. "Judgment of his peers" refers to the trial of a vassal by his fellows in the court of their lord. It means something of which there is still an example in the trial of an English peer in the House of Lords or before his fellows in the Court of the Lord Stewart. Jury trial did not grow up from any of these modes of trial. It became a mode of trial after beginning as something else.

The clearly established and authentic history of the jury goes back to the ninth century. In 829 the emperor Louis the Pious, successor of Charlemagne, directed that thereafter royal rights should be ascertained not by witnesses produced by the parties interested but by the sworn statement of the best and most credible persons in the locality. At that time the rights of the crown rested in custom. The custom was to be declared by twelve neighbors upon their oath. It is possible, but the connection has not been established, that this administrative device was taken from a bit of Roman administrative machinery to be found in the fifth century

in the Theodosian code. At any rate it was taken over from the empire of the Carolingians to the Duchy of Normandy and thence to England. At first it was used by the government as a means of ascertaining and establishing its rights and was called an "inquisition," a term of which some memory still lingers in old forms of presentment and indictment and in "inquest of office found." A Norman duke or an English king sometimes granted to private persons or to churches the privilege of having their rights ascertained in this way. In Normandy in the twelfth century inquisition was made the ordinary mode of trial for all important civil litigation. In England soon afterward a series of enactments allowed it generally as an alternative mode of trial. From these enactments, which were called assizes, the inquisition of twelve men in certain proceedings got the same name.

After the Norman Conquest the inquisition went on as an administrative device to obtain information required by the government. Thus *Domesday Book* is a collection of answers by neighbors as to who owned land and other matters relating to land which the government needed to know for the purposes of taxation. In the twelfth century the inquisition was used to ascertain the customs as to the relations of church and crown and to discover crimes and criminals. Forfeitures and fines for crime were an important source of revenue. Hence it was important to compel the neighbors to answer the questions of the sheriff. By the last third of the twelfth century it was established as the regular mode of obtaining presentments of criminals and was thus on the way to becoming the grand jury.

In mediæval England trial by jury was not a logical but a mechanical mode of trial. In a logical trial, such as one before an Athenian dicastery or a Roman college of *judices*, the case of each litigant is made out by evidence and fully argued as to the points in dispute. The beginnings of law do not provide such trials. A chief purpose of law in such a stage is to keep the peace, and in times when groups of kindred were ready on small provocation to redress the injuries done their kinsman it was not politic to add a controversy as to the weight of evidence and argument to the controversy under adjudication. A single, simple test, as to whose application and outcome there could be no question, had to stand for the determining agency. At first and for a long time jury trial was of this type. The jury was a body of wit-

ness triers, responding to the exact single issue submitted to them by a verdict pronounced on their general knowledge as representatives of the neighborhood. Jury trial was extended at the expense of the other mechanical modes of trial partly because potentially it was a mode of logical trial.

In mediæval English law the chief modes of trial were ordeal (hot iron, boiling water, cold water and the morsel), wager of law, and battle. But in 1215 the pope forbade the clergy to take part in the ritual of ordeals, so that these became obsolete as a regular mode of trial. In the thirteenth century trial by jury had superseded all the mediæval forms of trial for criminal cases. The civil jury as it is today is derived from the old criminal jury. It comes to us through the action of trespass, which originally was criminal but became civil. By the end of the fifteenth century it was very near its modern form; it had become a body of impartial men who heard witnesses and returned verdicts on the evidence.

Three far reaching changes operated to bring jury trial into the order of reason and impart to it some degree of certainty: first, the practise of hearing witnesses and the development of a technique of trials; second, the working out of a rational system of review of verdicts; and, third, the development of the law of damages, which established an authoritative measure of damage for all important situations. The first was achieved in the Middle Ages. The second was completed about the time of the American Revolution. The third was still proceeding in the nineteenth century. Already in the Middle Ages, after beginning by summoning the named witnesses in order to assist the jury, it had become customary to examine other witnesses before the jury to help it to arrive at its verdict. Thus the characteristic common law method of trying cases as a whole, not in detached fragments as in civil law countries, grew out of jury trial. In mediæval practise the only mode of reviewing a verdict was by the clumsy process of attain, going back in its theory to the time when jurors were not triers on the evidence but told the court what the neighborhood knew. A new jury of twenty-four tried the first jury for perjury. If the first jury was found to have returned a wrong verdict, the jurors were imprisoned, they became infamous and their property was confiscated. Not unnaturally jurors were unwilling to subject a former jury to the severe penalties involved and by the reign

of Elizabeth attaint had ceased to be much resorted to. In the sixteenth century a new way of controlling the actions of jurors was sought in the Star Chamber, which began to punish them for verdicts against obvious evidence. But because of the political prosecutions of the sixteenth and seventeenth centuries this was a dangerous power in the hands of an administrative tribunal controlled by the crown and in Bushel's case, decided in 1670 (Vaughan, 135), it was settled that the obsolete attaint was the only legal pressure upon a jury. Indeed in that case Chief Justice Vaughan went so far as to say that a jury ought to be completely free from direction from the bench. The reasoning of the court is interesting: the jury might have acted on evidence unknown to the court. It is apparent that the conception of the jury as a body of witness triers still survived.

In the Middle Ages courts had allowed new trials for misconduct of jurors, and during the Commonwealth the upper bench took the notable forward step of granting a new trial for an award of excessive damages against the charge of the court. After the Restoration this decision was questioned, but the practise of granting new trials was not established until the eve of the American Revolution. As to the legal measure of damages, Sir Edward Coke had said that the jury were chancellors, in other words, that they had an uncontrolled discretion. It was not settled that there was a legal measure of damages in cases of tort until the nineteenth century, and a remnant of the power to award damages as the jury likes still exists in cases of punitive damages for wilful and wanton wrongs.

Political prosecutions for libel in the eighteenth century led to Fox' Libel Act of 1792 making the jurors judges of the law as well as of the facts in such cases. Except for this one crime, however, there has been a steady development in England toward complete judicial control of jury trials and full exercise of the common law power of the courts to advise on the evidence and direct verdicts in accordance with the law. The colorless type of charge to juries which Dickens satirized in the *Pickwick Papers* became a thing of the past in the last quarter of the nineteenth century. Jury trial had been developed into an effective instrument in England about the time that the civil jury was to become moribund.

At common law the jury was selected by the sheriff upon a writ requiring him to cause twelve good and lawful men of the vicinage to come to

serve as jurors. If the jurors were not properly chosen or not qualified, there might be a challenge to the array; that is, the whole panel might be challenged. If particular members of the panel were subject to objection there might be challenges for favor; it is an interesting result of the conception of jurors as witness triers that the causes of challenge were taken from the rules of the canon law as to the competency of witnesses. These challenges were tried by triers appointed from the qualified jurors. There might also be a certain number of peremptory challenges for which no reason need be given. If twelve qualified jurors did not remain, the sheriff was directed to bring in a certain number of qualified men from the bystanders—*tales de circumstantibus*—called talesmen from the first word of the term describing them. The panel now being full, the jury was sworn "well and truly to try the issues and a true verdict render." At this point the trial technically begins. Junior counsel for the party having the burden of the issue then opens the pleadings, stating briefly the nature of the case and the issue to be tried; and senior counsel for that party opens his case, setting forth the case as his client claims it to be, what he expects to prove and how he expects to prove it. He then calls his witnesses and examines them orally before the court and jury, after which they are severally cross examined by counsel for the adverse party. When all the evidence for the party which has the burden of the issue has been presented, counsel for the opposing party addresses the jury, commenting on the case made against him, setting forth his version of the facts and stating, if he intends to produce witnesses, what he expects to prove and how. If witnesses are called they are examined and cross examined and counsel for the party having the burden replies. In a civil case if as a matter of law there could be only a certain verdict, the trial judge may direct the jury to return that verdict and it is entered on the record accordingly. But in a criminal case only a verdict of not guilty can be so directed. If there is a sufficient case to go to the jury, the trial judge then charges the jury; that is, addresses them orally, explaining the issue or issues on which they are to pass, stating the law applicable thereto, summing up the evidence on each side and, if he thinks proper, discussing and commenting upon it. The jury may find a verdict on consultation with each other without leaving the jury box or

they may retire to the jury room in charge of an officer of the court. Originally jurors were kept there without food or drink until they agreed on a verdict; a mediaeval judge even threatened to put them in a cart and take them about with him at circuit until they reached an agreement. But in modern practise if the court becomes satisfied that they cannot agree, the jury is discharged and the case is retried before another jury. When they agree (for at common law the verdict must be unanimous) their verdict is delivered orally in open court by the foreman and the jurors are then asked collectively if that is their verdict. If they say that it is, a party may ask that the jury be polled; namely, that each juror be called by name and asked if that is his verdict. If all are agreed, the verdict is entered on the record and the jury discharged; if not, they may be sent back for further deliberation. Instead of a general verdict in the very terms of the issue there may be a special verdict: the jury may find the facts in detail and pray the judgment of the court as to how the issue should be found in view thereof. This practise comes from the days of attain, where the jurors sought to avoid the risk of a wrong verdict on a doubtful point. It is used where the facts are not disputed and only the legal result is doubtful. The special verdict is drawn by counsel and formally agreed to by the jury. The trial judge may submit special questions to the jury along with his charge or when the verdict is announced but before it is recorded and take the answers of the jury thereto. The issues being thus determined, it remains for the court to give the judgment which the record requires.

Such is jury trial at common law. It has, however, been much modified in its details in the United States, and most of the features which are now felt to call for reform grow out of those modifications. When jury trial was brought to this country in the seventeenth century, it was still essentially mediaeval. The practise of granting new trials where a verdict was clearly against the evidence was still in its beginnings. Much of the judicial guidance or control which is required to make jury trial efficient was still to be developed in England. In many of the states of the United States new trials were granted only for the mediaeval reason of misconduct of the jury and in effect the jury is as uncontrolled as in the seventeenth century. In other states it has required statutes to give the courts power to review

verdicts rendered against the evidence, and the statutory provisions, made too often with reference to some particular miscarriages of justice, have not always been drawn wisely or well. Unfortunately the legal checks upon the jury were developed independently and under pioneer conditions. The results, when functioning in the urban, industrial America of today, contribute not a little to current dissatisfaction with the system.

But the chief cause of dissatisfaction is to be found in the excessive powers which have been committed to jurors in the several states. The jury had grown up as representative of the local community. The jurors were not witnesses testifying. They were representatives of the knowledge and traditions of the locality. This representative character of the jury appealed powerfully to colonial, to pioneer and to democratic America. Then too in the seventeenth century struggles between courts and crown juries had proved an effective check upon the crown. Juries had used their power of rendering general verdicts and the legal requirement of a verdict as the basis of a judgment to thwart royal attempts to enforce certain laws peculiarly obnoxious to Whigs and Puritans. The colonists who had the most weight in determining American institutions came to the New World with a strong dislike for efficient law enforcement and bias for jury lawlessness. This was confirmed for lawyers by the account of the jury as steadfastly upholding the immemorial rights of the ordinary Englishman against arbitrary governmental action which they found in Coke's *Second Institute* and in Blackstone. It seemed to Americans more important to preserve the jury as a bulwark of political liberty than to make it an efficient tribunal. This feeling was reenforced by jury resistance to colonial governments on the eve of the American Revolution and by jury resistance to unpopular legislation during the rise of Jeffersonian democracy. The political importance of the largely uncontrolled or ill controlled powers of the seventeenth century jury, as it was brought to America, led Americans to assume that resistance to laws was more important than enforcement of law and to exaggerate the scope of jury lawlessness. There was even a tendency in some states to extend jury trial to equity, where historically it had no place, and when law and equity powers were given to the same courts to be exercised in the same proceedings, to assume that in the fused procedure issues of every sort were to be

tried by juries. But on the whole the historical view prevailed in this particular connection and jury trial was confined to legal as distinguished from equitable features of the combined proceeding.

But the most characteristic feature of American development of jury trial is limitation of the common law powers of the trial judge. The New World had been settled in large part by colonists who sought to escape the religious and political prosecutions in which masterful judges had played a conspicuous part. Subsequent immigrants brought with them memories of the trials in which Jeffreys showed the terrible possibilities of a strong personality on the bench taking charge of a prosecution. The tradition of such judges, reenforced by the conduct of some royalist judges in the events which led to the revolution, and the conduct of some strong federalist judges at the end of the eighteenth century, created a deep seated jealousy of the trial judge which has persisted in American legal and judicial institutions. While English legal institutions were adopted in other respects, radical departures were made from the English model in respect of the powers of trial judges. It is significant that this jealousy does not extend to equity judges or to judges of appellate tribunals. The scope of injunctions has been greatly extended. Appellate judges are allowed powers with respect to legislation which no other judges exercise anywhere. But Americans have been and on the whole remain unwilling to allow trial judges in actions at law the authority without which justice cannot be administered effectively in the society of today. It is true that in the federal courts the judges have retained their common law powers. Yet here too in many parts of the country the circuit courts of appeals have been cutting down those powers on the analogy of the state practise.

American states very early began their departure from common law rules by requiring the charge of the court to the jury to be in writing, and generally throughout the land by custom, judicial decision or legislation trial judges were deprived of the power to comment on the evidence or discuss its weight or advise as to its application. Many jurisdictions confine the charge to the giving of abstract written "instructions" on points of law involved. Some make the jurors judges of the law as well as of the facts, in criminal cases at least. Many take the power of fixing the sentence away from

the judge at least in offenses of great seriousness and commit the measure, duration and form of penal treatment to the trial jury. Some of the causes of this shearing of judges of their common law powers have been referred to. To these it should be added that for a long time and in many jurisdictions colonial justice was administered by magistrates who had no special competency to advise or assist juries. But most of all it must be borne in mind that pioneer communities were caves of Adullam to which everyone who was in debt or in distress or discontented repaired to begin anew, and the Adullamites had no desire that their creditors pursue them into the wilderness. Extravagant powers of juries uncontrolled by judges appealed to the pioneer, not only because an unfettered jury trial afforded a spectacle in times when the theater, the moving picture, the radio and the automobile were not at hand but especially because jury lawlessness and pitfalls of procedure were often the only defense. Later the ideas and practises to which these conditions gave rise were taken advantage of in the contests between habitual plaintiff's lawyers and habitual defendant's lawyers which went on in all American courts after the rise of great public service and industrial corporations with permanent and well organized legal departments. One group relied on the power of juries to render general verdicts free from control by the courts; the other on a highly technical procedure full of pitfalls which provided opportunities for setting aside verdicts and obtaining new trials. The elaborate codes of civil procedure which prevailed in the second half of the nineteenth century and the hypertrophy of appellate procedure, serving as a check upon review of jury trial for "error," are to be explained in large part by this contest. Moreover the weakness and tendency to abdicate such powers as they had, frequently manifested by trial judges elected for short terms, served still further to render jury trial in this country inefficient and unsatisfactory.

In contrast with its great popularity in the eighteenth and nineteenth centuries the jury system is now almost everywhere under attack. All American constitutions guaranteed it as essential to liberty and free government. Today it is being modified or restricted on every hand or is becoming disused. In England, while the jury in criminal cases operates well and is not criticized, the jury in civil cases is almost obsolete. There is now a well established prac-

tise of resorting to it only in cases involving legitimate appeal to the emotions, such as assault and battery, malicious prosecution, false imprisonment, defamation and breach of promise of marriage. In the United States waiver of jury trial or reference of cases to referees or auditors has become increasingly common. In a growing number of jurisdictions a civil jury is not to be had unless expressly demanded. In some of these when one demands a jury he must advance at least a part of the expense. Moreover the growth of administrative tribunals at the expense of the common law jurisdiction of the courts and the development of elaborate machinery for commercial arbitration are due largely to distrust of civil juries and are means of avoiding them. To this growing disuse must be added a long list of modifications which indicate a moribund institution. Majority verdicts are now allowed in many jurisdictions. In some the jury is required to answer in writing a large number of special questions. In some the scope of special verdicts is increased and the practise of finding them is facilitated. It would serve no useful purpose to go into details or to specify jurisdictions. There is so much legislation and changes are so frequent and differ so much in detail that any exact statement would be out of date almost before it was off the press. Suffice it to say that continual tinkering with the civil jury has achieved little improvement and is not likely to do so unless and until the common law powers of the trial judge are fully restored. There is danger that before this fundamental reform can be brought about confidence in the civil jury will have been so wholly lost that no reform can re-establish it. As to the jury in criminal cases, that also is under attack generally but more as the result of the changes made in pioneer America than from inherent defects in the common law institution. A criminal trial before a jury made judge of law as well as of facts, with the judge restricted to the position of an umpire in the almost unrestrained contest of counsel, with the duty of fixing the penalty left to the jurors and so made to complicate the question of guilt, with the charge of the court reduced to a written dissertation on abstract points of law, is not a jury trial in the sense of the common law and is not the jury trial which made that institution one of the glories of English law. As it is, the steady growth of waiver of jury trial in criminal cases and the extension of summary criminal jurisdiction

present a story very similar to that of the civil jury.

There are compelling reasons for believing that the jury in criminal cases will endure. As a device for political education of citizens who do jury duty its importance has perhaps been exaggerated. Such education is expensive and is less necessary under the conditions of diffusion of information today than it may have been in the past. But the jury of the vicinage is a truly representative institution, and a representative local judgment upon conduct has a value which atones for many shortcomings. The bad features of the jury system in criminal justice in America are mostly traceable to want of control and want of power of control by the trial judge and the abuses which have grown up in consequence. Thus in an American state criminal trial of any importance it is usual to take up many days in elaborate and detailed examination of prospective jurors in order to secure an absolutely unbiased panel. Where a jury has extravagant powers and the trial judge can do no more than give academic explanations of abstract points of law this may be necessary, but it is significant that no such protracted examinations are heard of, because they are not needed, where the judge has and exercises the common law powers.

It must be remembered that the jury in criminal cases served as one of a long series of mitigating devices in criminal procedure. That list is now excessively long in America: the discretion of peace officers as to whether or not they shall report or arrest offenders; the authority of the magistrate to discharge upon preliminary examination; the power of the grand jury to ignore indictments; the discretion of the public prosecutor as to whether or not he shall prosecute; the authority of the jury to acquit by general verdict in the face of the evidence; the discretion of the judge to grant a new trial; the discretion of the judge as to sentence, suspension of sentence and mitigation of sentence; the individualizing power of administrative officials by way of parole; the executive power of pardon. This long list comes down from the era of capital punishment for all serious offenses and the later era of political prosecutions. Obviously it is much too long. But there are other points at which to strike, especially in the American additions to the list as it stood at common law. On the other hand, the jury system in criminal cases stands in need of much improvement. The rapid growth of ex-

forcement of laws against vice by injunction rather than prosecution is due largely to the ineffectiveness of jury trial for such cases. Indeed with the rise of the problem of enforcing law in the urban, industrial society of today a much more efficient criminal trial system is imperative.

As to the civil jury it has been much overworked in the United States. It was a good tribunal in the old time rural, agricultural society, where the jurors knew the men and the things involved in local litigation. But the city dweller of today seldom knows his neighbors and the range of his interests and knowledge is specialized. Most of all, however, the civil jury is too expensive. It wastes the time of jurors, parties and witnesses beyond what is justified by any advantage it may have. In cities where courts sit to try cases continuously the year round the drain of jury service is serious and in the end those who would make the best jurors evade service because neither they nor the business of the community can afford to have them taken from their everyday work. If for no other reason, the expense of the civil jury as an ordinary tribunal for ordinary controversies is likely to make it obsolete in the economic order of tomorrow.

ROSCOE POUND

OTHER COUNTRIES. No institution of English law has achieved so universal a reception as the jury system. In the nineteenth century the jury, introduced into civil law countries, became virtually a world institution. If it is true that the English jury owed its origin to early forms of continental procedure—for Brunner's conclusions as to the royal and inquisitorial origins of the jury have been somewhat questioned since the appearance of the work of Meyer—the debt was thus amply repaid. It must not be supposed, however, that the transplanted institution was any more an exact copy of the English prototype than was the American jury. In fact it was not the English but the French jury, representing a considerable modification of the English institution, that served as a model for civil law countries.

The jury was ushered into continental countries as a result of the French revolutionary movement. It had been among the English institutions greatly admired by the French *philosophes*. With its oral and public procedure it seemed to them ideally suited to undermine the old secret inquisitorial procedure. Moreover

the substitution of the principle of the free evaluation of proof for the system of legal proofs seemed to make the jury imperative. Only a jury of citizens could be left free to judge on the basis of their own intimate conviction. Thus the *cahiers* of 1789 demanded the introduction of trial by jury in criminal cases, and the Constituent Assembly established it by the law of 16-29 of September, 1791. The jury system thus introduced survived through consulate, empire and republic. When its retention was debated in the State's Council in the course of the drafting of the Code of Criminal Examination of 1808, it was curiously Napoleon who was its staunchest defender, for the first consul realized that it would be a useful weapon in his hands against the old aristocracy. Established in some of the regions that were under the Napoleonic hegemony, the jury made its way very rapidly in the Latin countries, which in all matters followed almost precisely the Code of Criminal Examination.

Almost everywhere the triumph of the jury system was assured by the revolutionary movements of 1848. Its reception in all but a very few of the German states at this time proved decisive. The jury had been retained in the Rhine provinces after their emancipation from French domination, and a number of *causes célèbres* in those provinces made the jury a subject of great debate throughout Germany. German legal scholars became interested in the institution and there began in the 1820's the long series of German works devoted to its origins. For the period before the Frankfort National Assembly it may be said that on the whole the majority of German jurists were opposed to the introduction of the jury. Feuerbach shrewdly realized that it would not be a liberal agency until the forms of government of the European states were fundamentally modified. The enormously influential Mittermaier was at first opposed to it. But popular clamor for it was not to be resisted.

In the second half of the nineteenth century the jury continued its conquests and even made its way into the regions of benevolent despotism. In Spain it was suppressed in 1875 after a short trial but was restored in 1888. It was even introduced into imperial Russia in 1864. The German Code of Criminal Procedure of 1877 accepted the jury for the whole empire, and the end of the century saw it established in the Hapsburg dominions as well. It prevailed of course in most of the Swiss cantons, and while it encountered a good deal of resistance in the

Scandinavian countries Norway yielded in 1887. In fact the only important European country to refuse to admit it for any purpose was the Netherlands. Its acceptance in the Latin American countries was fairly general.

In France the jury system has undergone scores of changes since 1791, and it has often been somewhat modified in detail in the other civil law countries which have based their systems upon the French. But few of these have departed very radically from its basic principles. Where fundamental changes have been introduced they have been determined by the necessity of accommodating the jury to so many diverse forms of government.

In civil law countries the jury is not employed in civil cases, with the possible exception of its use to assess the value of property in condemnation proceedings, as in France. Moreover it is everywhere recognized that even in criminal cases the use of the jury is to be confined to the trial of major offenses. Thus the jury has been regarded in these countries as an exceptional institution from the very beginning. The dominant tendency has been to confine it to the trial of "crimes," using the term in the technical sense of the tripartite continental division of offenses into crimes, delicts and contraventions. The principle of unanimity in the decision of the jury has been rejected from the very first. The verdict is usually arrived at either by a simple majority or by a two-thirds vote. The present French law provides for the former; the German code of criminal procedure of 1877 required the latter.

The actual organization and conduct of a jury trial do not differ very radically from those which prevail under the Anglo-American system. Almost everywhere the jury has been composed of twelve jurors. They are usually chosen by lot from a small panel and provision is made for peremptory challenges as well as challenges for cause, but as in England there is no elaborate examination of talesmen. The most important difference between the continental and Anglo-American systems in the conduct of the jury trial is the absence in the former of cross examination of witnesses. The questions are put by the president of the court, and the only opportunity of counsel to attack the case of the prosecution is in the address to the jury. Since there are no strict exclusionary rules of evidence the witnesses usually have the advantage of haranguing the jury upon any point in any way related to the case. When the testimony is com-

pleted, a summary, or *résumé*, of it is made by the court. This feature was abolished in France in 1881 because of its abuse by ambitious presiding judges, but the prevailing doctrine is that the judge may summarize the evidence for and against the defense, provided that he does not comment upon it in any way. In the actual presentation of the case to the jury the civil law practise differs from that of the common law in a curious way. There is no general finding of guilty or not guilty. The jury is given a series of written questions to answer based upon various premises as to the facts, and the questions must be framed in such a way that they may be answered "yes" or "no." The practise in the framing of questions, which at times has run to a considerable degree of ingenuity, is reminiscent of the Roman formulary procedure.

The jury has everywhere been regarded as the "palladium of liberty," but devices have often been found in civil law countries for reducing its effectiveness in this role. The classes that might be opposed to the interest and desires of the government have sometimes been legally excluded from eligibility for service and a governmental functionary has been given a further right of scrutinizing the final lists. The best example is the composition of the jury under the Napoleonic regime: the basis of eligibility was made extremely narrow, and the prefect was given virtually dictatorial powers over the lists. The basis for the composition of the jury in France has changed in accordance with the character of the regime in power; the present liberal system rests upon the law of 1872. Another effective governmental expedient has been to limit the competence of the jury. Thus in autocratic countries political crimes and offenses of the press have been specifically excluded from its competence. In other words, the jury has been confined to the function of judging ordinary crime. Where the jury system was established in Russia, its use was excluded not only in political crimes but in such offenses as rape, bigamy and resisting arrest. The democratic countries on the other hand have specifically included within its competence delicts of the press and political offenses. In some countries jury trial has been provided only in the case of delicts of the press, as in Sweden. In Chile a law of 1872 provided for the trial of press offenses by a jury of seven.

In the present century a few gains have been made in the further introduction of the jury system: a constitutional guaranty of jury trial

was included in the post-war constitutions of Poland and Austria; and in 1924 the jury was introduced into imperial Japan except for political offenses. On the whole, however, the institution has been on the decline. It has been abolished in some Swiss cantons. In France there has been a growing practise of avoiding jury trial where possible by basing the prosecution upon such elements of an offense as will constitute it only a *délit*. This "correctionalization of crimes," as it has been called, is very reminiscent of the practise of American district attorneys in accepting pleas. Everywhere there has been a growing discontent with the jury system, and there are not many continental jurists who have much to say in its favor except in connection with press and political offenses. French jurists have pointed to the readiness with which juries in their country have acquitted in cases of sexual offenses and the great severity they have shown in cases of property crimes. Ferri and Garofalo give accounts of the functioning of Italian juries that are almost incredible. In some of the provinces, it seems, jurors have almost had fixed scales of charges. Verdicts of acquittal have been common when the accusation has been that of embezzling public money. In regions dominated by the Mafia and the Camorra juries have been continually intimidated.

The most serious threat to the continued existence of the jury system in its present form is a growing movement to turn the jury into a board of lay judges, called *Schöffen* in Germany and *échevinage* in France. The tradition of lay judges is an ancient one in Europe, going back to the *scabini* of the Merovingians. Indeed some of the early attempts of German scholars to trace the history of the jury attributed its origin to these lay judges. Although the difference between a lay judge and a juror has come to be recognized, a tendency has persisted to regard lay participation in the administration of criminal justice as the essence of the jury system. In a jury trial the whole judicial function is divided between the judges and the jury, while in a trial before lay judges there is no such division of function. The current movement aims to combine the permanent judges and the jury into one bench, acting as a unit in deliberating and reaching a decision as to both guilt and punishment. A court of *Schöffen* composed of one permanent judge and two laymen had existed in Germany under the code of criminal procedure of 1877 for the trial of various minor

offenses. Courts composed of various numbers of professional and lay judges had functioned also in other Germanic countries and perhaps elsewhere. Such mixed courts had existed in the French and Italian colonies even for the trial of serious offenses. In 1924 Germany abolished its jury system in the case of all major crimes and substituted for it a court to be composed of three permanent judges and six laymen to sit and deliberate together. Its competence was severely limited to treason, crimes of homicide and a few other offenses. The change was made under a plea of economy, and the new institution is still called a jury (not *Schöffengericht* but *Schwurgericht*) but it is such only in name. The advantage of combining the lay and professional judges is obvious. The former have the guidance of the expert knowledge and experience of the latter, and the processes of judgment as to law and fact, formerly separated, are advantageously united. But it is no less equally obvious that the lay judges will tend to be overawed by their professional colleagues. Moreover since the advice of the professional judges is no longer given to the laymen from the bench in open court, the guaranties of publicity no longer exist. It is significant that a system not unlike the German was introduced into Fascist Italy in 1931 and that a similar system is used in Soviet Russia for the trial of offenses in all criminal courts. The Soviet court is composed of a permanent judge and only two lay judges, and the verdict is reached by a majority.

When it is considered that the criminal jury has been on the decline in common law countries as well—England, the birthplace of the modern jury, has witnessed a tremendous growth of "summary prosecution," and in the United States waiver of jury trial is becoming increasingly common—one is forced to look beyond local causes for a fundamental explanation. It is doubtful whether procedural differences between common and civil law countries can be considered to exercise the decisive influence on the fate of the jury system. The rule of unanimous decision and the system of elaborate examination of talesmen have often been blamed for its decline, but civil law countries have complained of the jury although they have known neither. The mere power to comment on the evidence has never sufficed to control a jury that wished to go contrary to the judge's opinion. Continental jurists have recognized frankly that the separation of law and fact in jury procedure is chimerical. Everywhere the jury tends to be omnip-

otent, in fact if not in law. Even the legal exclusion of the popular and heterodox classes from the jury in some of the civil law countries can be overemphasized. Jury packing has not been unknown in England and in the United States, where such an exclusion is not provided for. In all countries, whatever the provision of law, the middle class tends to dominate in the jury system. An explanation for the dissatisfaction with the jury system should rather be sought in the fact that technically the jury represents a rather cumbersome procedure and politically a means for effectuating the will of the middle class. A great deal can be said for the jury, but it may as well be recognized frankly that efficiency in the trial of causes is not among its virtues.

JUS GENTIUM as a Latin phrase might mean the law which governs the citizens of all nations or the law which governs the citizens of a limited group of nations or else the law which governs the nations themselves in their relations with each other. It is doubtful whether the second of these meanings was ever adopted, but the first and last were frequently attached to the phrase in ancient and in modern times and both have been fruitfully developed.

What were the gentes? Apparently not the Roman clans, which were ancient and important institutions, although there was a law that related to them and this law must at an early time have been of great moment. But this law was known as *jus gentilicium*, and the fact that it was never called *jus gentium* indicates that the latter phrase did not come into existence until the gentes as clans had lost importance and the gentes as national units had gained it. This must have happened some time before the completion of the conquest of Italy in the third century B.C.

The various instances of the occurrence of the phrase have in recent times been exhaustively collected. When they are carefully examined,

there ought to be little doubt that the earliest informal definition, that given by Cicero (*De officiis* III: 5, 23; III: 17, 69; and *Tusculanarum disputationum* I: 13, 30), contains the fundamental notion of the term. Cicero says that the *jus gentium* is the law which natural reason has established among all nations, and there is little reason for qualifying or doubting the accuracy of his statement. Certainly there is no real support in the sources for the supposition that the *jus gentium* was a non-Roman law, the law of non-Roman gentes, in the sense in which the word gentiles is used in the Bible. The *jus civile* is not contrasted with the *jus gentium* but as far as it was rational is conceived as a part of it.

It is necessary, however, to qualify the implications of the English version of Cicero's definition. The gens in his sense was a group of persons who professed a common descent and dealt with one another as people who had common interests and a certain amount of common responsibility. It was not necessarily an organized political unit. Every gens had certain peculiarities of its own. The *jus gentium*, since it was the law which all of them used, must be the common element in the *jura* of the several gentes. It was not, at any rate not at first, an ideal law which all men ought to follow but the body of common rules which gentes, however diverse, did actually follow. At a later period it was a favorite exercise of rhetoric to point out the extreme discrepancies that existed between the laws of various nations. But when the phrase *jus gentium* first came into common use in Rome, perhaps in the third century B.C., it is likely enough that the gentes envisaged contained few violently idiosyncratic examples.

The Roman must have thought of the *jus gentium* as containing no inconsiderable body of usages and of usages which were quite concrete and specific. The real question, however, is not so much what the *jus gentium* was but what its significance was. What was its relation to the ordinary law? Evidently a Roman magistrate enforcing law in the ordinary cases between Roman citizens would not be likely to appeal to it, since as far as it constrained him it was part of the *jus civile*, which he was bound to administer. But when he had to enforce law between Roman and non-Roman or when the Roman law as formulated in statute or in concrete customs was for one reason or another inapplicable even in cases involving only Roman citizens, the magistrate was required to act justly and conscientiously; in such cases it was a powerful confirmation of

conscience and justice to find a rule established in the common practise of all or nearly all nations, i.e. in the *jus gentium*.

It is evident, however, that when a doctrine of natural law is established, empirical institutions developed in the *jus gentium* might be found to be in contradiction to it. One such system of principles of justice, the stoic doctrine of natural law, did in fact classify several of the institutions of the *jus gentium*, for instance, slavery, as unjust or morally indifferent. And this particular form of natural law exercised a powerful influence on many stoic trained jurists. It is this doctrine, as quoted by Ulpian in the third century, which has been transmitted to modern times as the classic statement of what natural law was and how it differed from the *jus gentium*.

But the stoic doctrine was neither the only one nor the prevailing one among ancient jurists. In most cases they clung to Cicero's definition in which "natural reason" is given as the source of the *jus gentium*. When the gentes concerned were no longer the Italian states around Rome but a complex of nations extending from Britain to Mesopotamia and beyond, the common element in the practises of all of them could hardly be less than a law dictated by nature itself. It is so defined by Gaius in the second century. That is, there was no real difference among writers of this group between *jus gentium* and natural law. The later jurists used the terms interchangeably, and the Christian doctrine that natural reason is of divine origin strengthened rather than weakened the tendency to equate them. It may be said that there were as many kinds of natural law as there were philosophic schools or religious sects and that there was only one kind of *jus gentium*; but the two would of necessity coalesce.

It was inevitable that the larger and apparently more comprehensive term should be the more successful in the early Middle Ages; in the early schoolmen and publicists *jus gentium* is of rare occurrence, even though the popular cyclopaedia of the Middle Ages, Isidore's *Etymologies*, fully defines the term. Upon reading this definition one is struck by the fact that all the elements tabulated and listed in it are of a special sort. They have to do with matters which had at all times been declared specifically to be a part of the Roman *jus gentium* but which had been of little importance in the time of Rome's primacy.

This was the *jus gentium* in the sense of modern international law, the law that regulates the conduct of gentes among themselves. It is sometimes inaccurately said that modern interna-

tional law was the equivalent of the Roman *jus fetiale*, or fetial law. This latter, however, was merely a special type of ritual used in declarations of war and in one or two other incidents of war. Its implications were always magical or religious and its importance was slight. But the substantial elements that were concerned in the conduct of gentes toward each other were definitely called rules of the *jus gentium* by ancient writers. These were matters like the obligatory force of solemn treaties, the inviolability of ambassadors, and rules of warfare, all of which have clear enough analogues or derivatives in modern international law.

Isidore's definition was quoted verbatim in the *Decretum* of Gratian, the foundation of the canon law, and accordingly was something of an axiom among schoolmen. Consequently the publicists of the fifteenth and sixteenth centuries were not conscious of having devised a new term or of having made a new application of an old one when they used *jus gentium* to describe the law which under the conditions of the time had assumed a new importance, the law that attempted to govern the several nations in their relations, either warlike or peaceful, with each other. The *jus gentium* as a branch of the law of nature rather than as identical with it provided a common basis of intercourse for nations, which no longer acknowledged a common religious authority. It must not be forgotten that the *jus gentium* was itself a *particula divini juris*. Perhaps such a phrase as Vitoria's *jus naturale gentium* was an attempt at describing the special character of this revised aspect of natural law; but the expression *jus naturae et gentium*, Milton's "law of nature and of nations," was more generally used until the term international law, *jus inter gentes*, superseded it. The great Spanish Dominicans in the sixteenth century laid a natural stress on the religious sanction of the *jus gentium* as authoritatively determined by the church itself. There can be little doubt that the analysis of this special *jus gentium*, which is particularly detailed in Ayala, powerfully influenced Grotius, but his *jus gentium* was compelled to justify itself by self-evident principles of morality and by the rationalized practises of Christian peoples rather than by appeal to authority.

The *jus gentium* of Grotius did not require absolute uniformity of all nations. It was enough that it included many nations. It passed through a period of development not unlike that of the Roman *jus gentium*, since the immemorial practises and moral ideals of west European nations

had a noticeable common fund which gave an apparent reality and fixity to its rules. International law even in the early nineteenth century could sometimes be regarded as applying only to Christian nations. Obviously modern conditions could tolerate no such anomaly, particularly when non-Christian powers, like Japan, China and Turkey, had to be admitted into the family of nations. The *jus gentium* considered as a *jus inter gentes* has accordingly in its expansion once more placed itself on the basis of a general moral sense, and its obligatory character has often been derived from that fact.

If *jus gentium* became limited to *jus inter gentes* in the early Middle Ages, the doctrines of the conflict of laws, which are usually traced to Bartolus, bid fair to recreate a kind of common *jus gentium* in the older sense. This branch of the law requires the application under definite conditions of a foreign law. The selection of the conditions, however, is based on principles of fairness assumed to underlie the application of any law not specifically statutory. And there is further a moral valuation often placed upon the foreign law before it will be accepted. This leaves at the bottom of the principles of the conflicts of law a certain modicum of *jus gentium* which is capable of considerable extension.

Again, all the tendencies of the study of comparative law have been to assimilate the laws of the countries compared. The mercantile law of Europe was from the beginning a sort of *jus gentium* and is becoming even more so under the pressure of commercial needs. The countries of continental Europe are in a fair way to produce a common private law of obligations, which has already exercised an attractive force on the Anglo-American law of contract. While the movement is consciously only in the direction of a *jus gentium* considered as a segregation of common elements in existing historical systems, it is inevitable that the necessary compromises must meet the test of fairness. Thus a *jus gentium* in the sense of a law common to the majority of civilized communities is not an impracticable ideal for the present and the concept has not lost its vitality.

JUS NATURALE. See NATURAL LAW.

JUST PRICE. Since the beginning of classical economics modern theories of value, whether objective or subjective, have viewed price as a purely market phenomenon. The just price, on the other hand, as a conception and as a doctrine is basically ethical rather than economic. In antiquity ethics was a branch of philosophy and the doctrines of the just price formed a part of philosophical systems. In the Middle Ages ethics was rooted in theology; and accordingly the just price was treated in theological works and in *summae theologicae*.

The general attitude of the Greeks toward economic matters is represented by Aristotle's conception of money and price. In the fifth book of the *Nicomachean Ethics* he sums up his views on this subject, which were constantly quoted, interpreted and developed by the mediaeval scholastic philosophers, with the terse phrase, "Thus has been explained what is just and what is unjust" (v: 9). Aristotle clearly perceived the importance of price in the exchange of commodities; and his emphasis on the place of labor time in the determination of prices has enabled modern theorists in both objective and subjective schools to hail him as their ancestor. But it is with the realization of justice rather than with price determination that the philosopher is concerned. Justice applies not to the inanimate but to the animate, not to the commodity but to the laborer; it is revealed not in the magnitude of an isolated unit but in the correct relation of that unit to the organic whole. Hence the just price does not attach to house or flour or shoe alone. There is rather a just price relationship between house and flour and shoe—a relationship corresponding to that between builder and farmer and shoemaker.

Individualistic Roman law made the determination of prices in commercial transactions entirely a matter of the legally free will. It is true that when mediaeval canon lawyers set out

to harmonize Roman law with the teachings of the church they discovered a rescript of the emperor Diocletian (*Corpus juris civilis: Codex* IV: 44, 2) which enabled them to read the Christian concept of an "objective" just price into the Roman code. This rescript aimed to prevent a too glaring disproportion between the contractual price and the "value" of a given commodity by guaranteeing redress to the seller in cases where the price amounted to less than half of the value. But in addition to the fact that it affected a trifling number of transactions the rescript was in essence un-Roman. It is indeed one of the clearest examples of the force with which the new Christian or rather oriental doctrines began in the third century to permeate and disrupt the Roman structure.

The Christians tried to base all important doctrines upon Biblical revelation. St. Paul's instruction to the Thessalonians that "no man go beyond and defraud his brother in any matter" (1 *Thessalonians* IV: 6) therefore acquired a special significance both for the church fathers and for the scholastics. It was from this source that Lactantius developed the doctrine that not only was it the duty of the seller to point out to the buyer the possible defects of the commodity but also that the buyer should never seek to profit by the seller's mistakes (*Divinae institutiones* V: 16). In St. Augustine's *De Trinitate* (XIII: 3) Paul's passage received a concrete illustration which for a thousand years it was virtually compulsory for writers on the subject to reproduce. It concerns the sale of a precious manuscript by an individual ignorant of the real value; the buyer—evidently St. Augustine himself—paid the just price (*justum pretium*), which was substantially higher than the one demanded.

How the just price was to be determined was a question raised neither by St. Augustine nor by writers during the following centuries which worshiped his authority. In the early Middle Ages, when over a wide area a natural economy had supplanted the money economy of antiquity and when significant changes in price occurred only as a result of crop fluctuations, it was easy to regard the traditional prices as just. At that time moreover the ethical precepts of the church had sufficient force to bind the faithful in every sphere of life. But in the eleventh and twelfth centuries the economic system began to lose its static character. A money economy reemerged in the Italian cities making it possible to satisfy new demands with new commodities; as a result of the crusades large

quantities of money and metals began to pour into the West. Once early capitalism had invaded the mediaeval structure, upsetting the existing social order as well as the traditional price system, the problem of what factors determined the just price could no longer be avoided. Albertus Magnus and Thomas Aquinas accordingly undertook the task of reconciling the traditional church doctrines with the ideas of the recently discovered Aristotle and with the new economic facts.

Albertus in his interpretation of Aristotle was the first to introduce the two concepts with which all the scholastics later tried to determine the just price: labor and cost (*labores et expensae*) (*Ethicorum libri* V: 2, 28). A more precise definition of the two concepts is attempted by Aquinas, who states that the measure of labor is labor time (*In X libros ethicorum ad Nicomachum* V: 5). Cost he leaves undefined, as might be expected in an age when industrial technique was only slightly developed and when there was little fixed capital and little variation between conditions and therefore costs of production. But for the determination of labor and cost taken together Aquinas stresses the significance of *conditio*, or social status: just as the worth of the person depends upon his class, so does the value of his service (*Summa theologiae* II: 2, 61, 2).

With this conception of the just price Aquinas was able to add an economico-ethical justification for the position of moral theology with regard to usury and interest. Commutative justice, he declares, is violated whenever the debtor forfeits more than the creditor (II: 2, 78). On the other hand, profit from commercial transactions is legitimate in so far as it represents a compensation for additional labor and cost, such as would be involved in transportation and storage. In such cases commercial profit is justified as *stipendium laboris* (II: 2, 77, 4). Thus it is incorrect to say that the just price as formulated by Aquinas and later scholastics was entirely devoid of economic content. What distinguishes it from all modern theory and practise is that it recognizes no validity for economic activity as such nor independent economic norms. Its law is derived from theological doctrines and from the philosophy of mediaeval class society. Because the just price was essentially not an economic but an ethical and social concept it did not necessarily coincide with the market price, which Aquinas calls *pretium datum*. For the same reason it was a component of the

objective order of things and was based on natural law: human society could not endure without just buying and selling and the just price (II: 1, 95, 4).

The social function of the doctrine was to prevent material gain from becoming the sole motive of economic activity, to extend the Christian way of life to the economic sphere and to safeguard the traditional social structure; its fate therefore depended upon the strength of the faith and of the church and on the authority of the secular power. As these declined progressively between the thirteenth and sixteenth centuries, giving way before the dynamic money economy or even succumbing to capitalistic practises, the possibility of retaining the doctrine in its rigid form diminished correspondingly. To keep pace with economic development thinkers like Henri de Gand, Duns Scotus, Buridan, Nider, Langenstein (Henricus de Hassia) and others continuously offered additions and modifications. A comprehensive system integrating and supplementing these ideas was presented early in the Renaissance in the *Summa theologiae moralis* of Antonino of Florence (4 vols., Venice 1479-80; new ed. Verona 1740).

At a time when the rise of a new artisan and merchant class to wealth and political power had given striking evidence of the changes in the economic set up and of the dissolution of the static order by the forces of capitalism, it was no longer possible to make the preservation of the mediaeval class structure the determining principle of the just price system. Antonino as well as Bernardino of Siena tried to justify the new economy before the bar of divine justice and natural law by recognizing as elements in the just price not only *labor* and *impensae* but also *industria*—the zeal, diligence and creative activity of the new entrepreneur. *Industria* was even legitimate excuse for the merchant to profit by fluctuations in prices and in money value. With this broad view a closer analysis could be made of the concept of cost, which the earlier scholastics had dismissed as a given, invariable quantity. Bernardino perceived that scarcity (*raritas*) was a presupposition of price, and remuneration for risk (*periculum*) a determinant. Antonino included as determinants both utility and scarcity and in addition a third element, the degree of pleasurable (*complacibilitas*). As a result of all these amendments price ceased to be treated as a numerically fixed magnitude: a margin was left for differences in person, place and time (*Summa* II: 1, 16, 3). In contrast to their

predecessors the late scholastic philosophers did not view the just price as a static norm; it became sufficiently loose to embrace dynamic market changes. Antonino distinguishes between three levels of the just price: the lower, intermediate and upper. In view of the uncertainty attaching to human calculations he makes allowance even for slight transgressions of these limits, although he is careful to add that "caution" should be observed in making this known to the public.

Despite this caution and despite the essential preservation of the principle of equivalence in exchange Antonino's doctrine of the three levels met the needs of early capitalistic economy. This is reflected most clearly in the surmounting of the difficulties which had been caused the scholastics by the problem of credit purchase and sale. Since the principle that time is not salable was the fundamental basis for the prohibition of usury, the scholastics were determined at all costs to keep it intact. They were therefore troubled by the fact that it makes a great difference to a merchant whether he sells a commodity for cash or on credit and that this difference is often revealed in the market price. According to Antonino's solution, if the intermediate level of the just price is accepted in cases of cash payment, then the upper level may be demanded in credit transactions (II: 1, 8, 1). Thus the gates of the church were opened to the emerging credit economy.

These changes, which necessarily affected the doctrine of the just wage—an integral part of the doctrine of the just price—and which were accompanied by similar amendment of the doctrines of capital, interest and usury, had important repercussions not only from the cultural and religious points of view but from the political and economic. As soon as justice was conceived as a sliding scale rather than an objective norm, the rigid barriers of social and political life were removed. Such governmental regulations as fixed prices lost their objective and metaphysical basis; the interests of the consumers, whose protection had been the chief object of the orthodox doctrine and the system of fixed prices, became secondary to the interests of the producers, who through the expansion of production upset the previous price system and discovered in price fluctuation itself a new source of profit. The extension of the doctrine of the just price, which reached its ultimate conclusion with Antonino, thus marks the point at which Christian theology abandoned its effort to save the

economic and social system of the Middle Ages.

The sixteenth and seventeenth century jurists who undertook the task of interpreting and developing the doctrine were too steeped in Roman law not to assign greater validity to the idea of the free contract in commercial transactions. Thus in analyzing the determinants of price Scaccia in his *Tractatus de commerciis et cambio* (1: 1, 436) relegated cost and labor to the last place and isolated as the primary factors the intrinsic worth of commodities (*bonitas intrinseca*) and supply (*copia vel inopia*). In the eighteenth century, when the physiocrats and classical economists made economics an independent science, the scholastic doctrine lost all significance; henceforth it was of interest only to historians and theologians.

In spite of the virtual disappearance of the doctrine the just price as an idea has managed to survive in the most diverse guises. The "natural price" of the physiocrats is nothing but the old just price in a secularized form and in the new terminology of natural law. Adam Smith's "normal value" is an obvious survival of the old doctrine. The classical economists since Ricardo and the marginal utility and mathematical schools have, it is true, insisted upon the autonomy of economics and have banished from their science the idea of the just price along with all metaphysical notions. But the socialistic labor theory of value represents an attempt to revive the idea of a proper or correct price, although this price is determined not by transcendental justice but by social appropriateness. The most recent doctrines of the universalistic school represented by Spann have gone so far as to resuscitate the just price as a concept. Should events prove that capitalism has begun to decay, a concomitant development may well be the reappearance of the "correct" and perhaps also of the "just" price as a regulative social principle.

JUSTI, HERMAN (1851-1909), American advocate of industrial conciliation. Justi was successively a clerk, statistician, merchant, bank president and coal operator. He was one of the leading and most influential originators of the practise of trade agreements and of the organization of employers' associations. Constant labor troubles, the violation of contracts and the emergence of a strong miners' union gave him the opportunity to put his ideas into practise. The five months' strike of the Illinois bituminous miners in 1897 made it evident that the temporary truce should be followed by permanent agreements and that the employers would be forced to organize for this purpose. Justi participated in the formation of the Illinois Coal Operators' Association and became its first commissioner, a position which he held until his death. The machinery set up involved no arbitration and constituted a sort of self-government for the industry. Representatives of the miners' union and of the operators met in annual convention to decide upon a general contract; minor questions or disagreements under the contract were settled by permanent machinery operating through the union's officials and Justi as commissioner of the operators' association. Similar machinery was soon created for the other states in the central bituminous coal district—Indiana, Ohio and Pennsylvania; operators and miners joined in conventions for interstate agreements and then for state, district and individual mine agreements. Justi actively propagated his ideas, which had considerable influence in spreading the form of industrial conciliation which he had been instrumental in setting up. Among his published writings, consisting of pamphlets and reprints of articles and speeches, are *Plans of Conciliation and Arbitration* (1900), *Conciliation and Arbitration in the Coal Mining Industry* (1902), *Arbitration, Its Uses and Abuses* (1902), *The Organization of Capital* (1903) and *The System of Joint Trade Agreements* (1905). Justi believed that the labor problem would be solved "in great measure" by universal adoption of trade agreements. "Worthy" unions should be recognized and employers should be organized into associations. He drew a distinction between the "consolidation" of capital to promote effi-

ciency and the "organization" of capital to deal with labor. "Strikes will occur," he said, "until organized capital can meet upon common ground and treat upon equal terms with organized labor." Justi proposed the organization of an American federation of industries (as a parallel to the American Federation of Labor) and a national board of arbitration, non-political in character and chosen by all the interests involved.

JOHN R. COMMONS

JUSTI, JOHANNES HEINRICH GOTTLÖB VON (1717-71), German cameralist. Justi, the leading representative of eighteenth century cameralism, taught at the Theresianische Ritterakademie in Vienna from 1750 to 1753 and at Göttingen from 1755 to 1757. In 1765 he entered the service of Frederick the Great as an administrator of mines. He died in the prison of Küstrin, to which he had been consigned in consequence of financial difficulties in his administration.

Encompassing the basic presuppositions of Justi's numerous writings on cameralistic and administrative science is the political theory which he makes explicit particularly in *Die Natur und das Wesen der Staaten* (Berlin 1760). An advocate of enlightened despotism, justifying the interventionist policy of Maria Theresa and Frederick the Great, he uses the postulate of the general happiness to provide an ethical foundation for the welfare state and explains the formation of the state by the social contract, entered into when the instinct for self-preservation impelled men to renounce their freedom. In these aspects of his doctrine he identifies himself with the mechanistic and rationalistic school represented by Wolff and Pufendorf, as in his general adherence to the mathematical method he belongs to the same group; but in conceiving of the social contract as tacit rather than express he is affiliated with the organic and evolutionistic tendency inaugurated by Montesquieu. Justi stands in fact at the conflux of these two currents. The extended analysis of political forms on which he bases his adherence to monarchy is reminiscent of Montesquieu. He judges "internal administration" to be the center of gravity of the state's power. After reaching the conclusion that a stable balance of power is rendered impossible by the diversity of national character he recommends the formation of a universal monarchy in Europe.

The essential theme of Justi's economic doc-

trine is the importance of stimulating population. Increase of population, which at least up to a still unattained point cannot be carried to excess since its effect is a corresponding increase in means of sustenance, conditions the growth of national wealth. In order to regulate the food supply a suitable proportion might be established between industrial and agricultural enterprise. Such devices as tax exemption, subsidies and extension of building credit should be employed to encourage the influx of foreigners. Justi's monetary theory makes money the symbol of national wealth, the economic expression of political power. Subscribing to the quantity theory as formulated by Montesquieu but rejecting the laissez faireist inferences drawn from the theory by French and English writers, Justi views prices primarily from the point of view of the producing interests. He devotes much attention to the problem of insuring a plentiful supply of working capital and to this end suggests borrowing abroad; various banking schemes for the better organization of credit—for instance, the foundation of a bank combining the features of mortgage bank and insurance company; the establishment of pawnshops and other credit institutions for the benefit of small scale artisans; and the creation of a *Manufakturhaus* to accelerate the sale of the finished products of the industrial class. Taking the ideal of economic self-sufficiency as his point of departure, he is more interested in effecting centralized control of industry than in commercial expansion. His demand for free trade is in line with his demand for the abolition of government price regulation, monopolies, trading companies and other privileges. He draws a sharp distinction between the "general" and the "particular" balance of trade. For the excise tax, the desirability of which constituted the principal problem of finance theorists of the time, he recommends the substitution of a tax on industry, arguing that the shifting of the excise would lead to a general and permanent rise of prices while only a partial rise would result from the tax on industry. Justi's significance for the development of systematic political economy lies in the fact that he endeavored to create a clear demarcation between this science, or cameralistics, and *Polizeiwissenschaft*, or the science of administration.

JUSTICE. The term justice is currently used in two senses: as representing, on the one hand, the faithful realization of existing law as against any arbitrary infraction of it; and as representing, on the other, the ideal element in all law—the "idea" which the law tends to subserve. It is only in the second sense that the term can have a separable and substantial meaning. But even in this second sense the idea of justice is often understood too broadly and is seen to merge with the entire content of morality. This generally applies to the extent to which law is undifferentiated from the entirety of moral and religious rules or to which philosophic conceptions are adhered to whereby such a differentiation is rendered impossible. It is only as one aims to establish precise distinctions between justice and moral and religious ideals that a clear conception of justice can emerge.

From this point of view the historical development of the idea of justice takes on meaning. Among primitive peoples religious conceptions,

particularly with regard to the survival of the soul and its destiny, are by no means based upon an unsatisfied sentiment of justice as they tend to be in the more developed religions; behavior in this world plays no part in the determination of the future state of the soul nor is immortality a compensatory justice. This is not to state categorically that religious representations in turn have no influence upon the idea of justice among primitive peoples. Their entire life and mental attitudes are imbued with these representations and their idea of justice is completely dominated by such of their mystical conceptions as their ordeals, human sacrifices and tabus.

In Greek civilization there were two opposing conceptions of justice—the popular conception as expressed in the tragedies and the philosophical conception as worked out by Plato and Aristotle. By the popular conception the gods were considered guarantors of human justice, which consisted primarily of submission to destiny; but the gods in turn were not required to observe justice in their conduct toward mortals. What stands out from a sociological viewpoint in this pagan conception of justice is the distinction made between two kinds of justice in its application to human relations: *themis*, or justice inherent in the life of the group, a disciplinary justice integrated with the functioning of the group; and *dike*, or justice external to the life of the group, a justice operative as between groups, families and individuals. Plato and Aristotle, while freeing the idea of justice from all connection with popular religion, failed nevertheless to distinguish sufficiently between justice and morals. This was due to their one-sided universalist conception, which tended to identify morals with the philosophy of law. Justice is, according to Plato, the supreme virtue which harmonizes all the other virtues. But since individual virtues are but reproductions in miniature of the virtues of the "social whole," which Plato considered as identical with the state, one could discover the nature of justice only by studying the harmony of the state. This harmony of the state—that is to say, justice—consists in each individual's accomplishing the task which the need of maintaining the social whole assigns to him; in other words, he must be a particular organ in the entire body. Aristotle modified this purely hierarchical conception of justice by admitting that justice implies a certain degree of equality; this equality might,

however, be either arithmetical or geometrical, the first based on identity and the second on proportionality and equivalence. Arithmetical equality leads to commutative justice, geometrical equality to distributive justice (to each according to his deserts). The second is the business of the legislator while the first is the business of the judge. Political rights and goods should be apportioned according to distributive justice; punishments should be imposed and damages paid according to commutative justice. Holding, as he does, that the supreme criterion of the good is the just mean or the equilibrium, Aristotle recognizes still a third aspect of justice: justice as a moving equilibrium which seeks to reconcile the demands of distributive justice with those of commutative justice. This conception recalls the antithesis in the popular mind between *themis* and *dike* without, however, completely coinciding with it.

Among the stoics justice is increasingly assimilated to the general law of the universe, to which all individuals considered as abstract and identical representatives of the human species must equally submit. This conception represents a transition toward the individualism of the Roman jurists, who borrowed the stoic philosophy and embodied it in their juristic theories. The definition of justice in the Digest (I: iv), "*Justitia est constans et perpetua voluntas jus suum cuique tribuendi*," inclines most to the commutative aspect of justice, but it combines it with the most pragmatic meaning of the term justice as the faithful realization of existing law.

In Hebrew thought the idea of justice passed through three phases corresponding to the three distinct stages in the life of Judaea: social justice, imposed and sanctioned by God; religious justice; eschatological justice. Before the first Exile justice was considered as an ideal principle having its basis in Yahweh and manifesting itself in human relations by benevolence, honesty and loyalty. During the Exile the idea of justice was transformed into "Pharisaic justice"—the strict observance of the divine laws and ordinances and rigorous fidelity to the rites. In the Hebrew prophets after the Exile the idea of justice may be regarded as a preparatory stage for Christian theories. Justice meant to the prophets the reentrance of the Israelites into the grace of God. It was the justice of salvation, of the peace and splendor of heaven and adumbrated the conception of justice among the pre-Augustinian church fathers.

The innovation that Christianity introduced into the conception of justice lay in its subordination to charity and love. Justice remains a purely theological and even eschatological idea, but being based entirely on grace it is to some extent differentiated from morality, which represents the incomparably more efficacious aspect of charity and love. And even this justice, surpassed as it is by charity, may not be realized, according to St. Augustine's teaching, except in the kingdom of God (*civitas Dei*), for it is nothing more than the harmony of the *corpus mysticum* encompassing the earth and the heavens. The visible manifestation of the *civitas Dei* being the church, it is only this institution which can constitute the stronghold of justice on earth. The state, independent of the church, has no connection with justice; it is a *latrocinium bene fundatum*—a deeply rooted brigandage indistinguishable in principle from other associations of brigands.

Into this patristic theory of justice Thomas Aquinas by reviving the Aristotelian tradition introduced some very considerable changes. He clearly distinguishes the *lumen naturale*, pertaining to man, from the *lumen divinum*, and in consequence the *lex naturalis* from the *lex aeterna*—human justice from divine justice. Thus there are other associations than the church—particularly the state—which may serve to advance justice, although the church as the manifestation of the *lex aeterna* stands supreme in this respect among all associations. Aquinas like Aristotle divides human justice into distributive and commutative justice but gives these terms meanings slightly different from the Aristotelian. With Aquinas commutative justice is the justice of contracts and exchange—an individualist justice. Distributive justice he understands in a more hierarchical manner than does Aristotle; the "all," in particular the state, whose harmony is achieved by this type of justice, he interprets not as a complex and objective equilibrium but as the creation of a commanding power, superimposing itself upon the community. What is most interesting about Aquinas' theory is the fact that it represents the first step toward the secularization of the idea of justice. It was the disciples of Aquinas—Biel, Almain and particularly Vasquez—who, in basing their theories on his conception that submission of the will of God to divine reason was immutable as well as on his differentiation between *lumen divinum* and *lumen naturale*, were the first to conclude that justice

would subsist even if there were no God—a thesis made famous in the seventeenth century by Grotius.

The complete secularization of the idea of justice could be accomplished only after the liberating effect of the Renaissance, which multiplied the worldly aspects of life, affirmed a way of salvation through activity that was peculiarly human and mundane and rendered society autonomous with regard to the *corpus mysticum*. But these secular consequences of Renaissance thought were not fully realized until the natural law school of the sixteenth and seventeenth centuries. The religious reformation and the political struggles unleashed by the Renaissance philosophy contributed in the sixteenth century rather to a reenforcement of theological conceptions of justice, as illustrated particularly in the theories of the monarchomachs, who attributed justice directly to the divine will intervening actively in political relations. The contract of submission (*pactum subjectionis*) of the people to the government, which the mediaeval theologians had already posited, is considered by the monarchomachs as sealed by God Himself. The violation of this contract by the monarch is therefore an offense against God, a revolt against divine justice, placing the monarch outside the law. Although the monarchomachs were not individualists, the connection of the idea of justice with the principle of the contract foreshadows the individualistic theories of justice of the seventeenth and eighteenth centuries.

The "natural law" school received its name primarily because it based all consideration of justice on the natural reason of man and opposed all consideration of the supernatural. Two currents in this stream of thought must be clearly distinguished: the individualistic current (the more influential) flowing through Hobbes, Pufendorf, Locke, Rousseau and Kant; and the social and universalist current most notably represented by Grotius, Leibniz, Wolff, Nettelbladt and the physiocrats. Although both are rationalist and secular, their conception of justice differs widely.

While the mechanistic and naturalistic individualism of Hobbes and Pufendorf leads to the identification of justice with the commanding will of the states, their followers Locke, Rousseau and Kant find the content of justice in the synthesis of liberty and equality. Positive laws and institutions that contradict these principles, such as the remnants of the feudal

regime, absolute monarchy and caste privileges, are considered unjust and hence illegal. Justice in society can be realized only by the deduction of all social order from a presumed contract of union (*pactum conjunctionis*) which guarantees the innate liberty and equality of men. Justice is not so much an objective order as a subjective consciousness, identical in all individuals; this is expressed particularly clearly by Rousseau. For him the idea of justice coincides with the principle of the "general will," which should not be confused with the popular will (or with the majority or the will of all) but represents "within each individual" the pure juridical consciousness "which reasons in the silence of the passions." When the individual finds that the laws and in general the commands of the public authorities contradict his consciousness of justice (his general will), the realization of which alone makes for liberty and equality, he is released from the obligation to obey. The idea of justice thus takes a distinctly revolutionary and even somewhat anarchic turn. It is true that all individuals are supposed to have an identical consciousness of justice (whence the term general will) and that the democratic and equalitarian regime is considered as a guaranty of the normal coincidence between the law and justice. Nevertheless, in case of conflict society as such may be dissolved by this recourse to the individual conscience, which is in the last analysis decisive. It is a theory of justice with almost illimitable depths of individualism and subjectivism.

In Kant the individualistic theory leads to a complete separation between justice and morality, a separation already suggested in Pufendorf. Since society, as contrasted with the individual consciousness, is stripped of all direct positive value and limited to the external relations of individuals, justice is confined to the regulation of external activity and to morality is delegated exclusively the concern with the inner life. Hence Kant's celebrated definition of justice, "Handle äusserlich so, dass der freie Gebrauch deiner Willkür mit der Freiheit von jedermann in einem allgemeinen Gesetz zusammen bestehen könne," or in sum—justice is the external liberty of each person, limited by the liberty of all others. The merit of this conception lies in its emphasis on the prime necessity for preserving the inner life of man, his religious beliefs and his opinions from all intervention by social authority. This it does by fixing clearly a line of demarcation

between morality and justice so that the latter may not serve as a pretext for such intervention. But there are palpable defects and dangers involved in this attempt completely to separate justice and morality. It regards justice as a purely external check imposed upon divergent wills; it makes for the avoidance of conflict but it does not organize any community of effort. And how can this external check be effected if not by a superior will which dominates other wills like a kind of mechanical force? It is highly significant that Kant in the applications of his theory of justice clearly approaches Hobbes: the individualistic theory of justice becomes necessarily etatist.

Quite another direction was taken by the social wing of the natural law theorists. Grotius, Leibniz and their followers in elaborating a new concept of society as the cooperation of beings endowed with reason defined justice as *custodia societatis*—"Justum est quod societatem ratione utentium perfecit" (Leibniz). Justice puts an end to the conflict between the individual and the universal, the microcosm and the macrocosm, and brings about the synthesis between the whole and the parts. That is why justice is by its very essence a *justitia communis*, which reconciles in itself and transcends the commutative, distributive and universal principles. Rational and secular, justice is nevertheless not subjective: it imposes itself upon the consciousness as an objective equilibrium between the principles just mentioned and it is superior to every individual or collective will, which should rather be put at its service. The distinction between justice and morality should not, according to Leibniz and his followers, tend to separate the two domains completely. Justice is "charity in conformance with wisdom." It is moral charity intellectualized and logicalized. "*Justitia hominis affectum erga hominem ratione moderatur*"; it is intermediary between love and reason or logical calculation. This theory of justice, which certainly deserves to be characterized as social and which was adopted for their various uses by a series of nineteenth and twentieth century thinkers, makes of every community and group a medium for the realization of justice, according no privilege whatever to the state. It is thus that Grotius, Leibniz and Wolff contributed particularly to the development of the idea of international justice which would achieve collaboration and peace in the supranational community.

The early socialist doctrines of the nineteenth century based their criticisms of economic inequality and disorder not on the idea of justice, which seemed to them a mirage produced by individualist preconceptions, but directly on the idea of love, of fraternity, of happiness, or of technology or prosperity. The same attitude of hostility to the prevailing ideas of justice and law may be observed in Auguste Comte on the one hand and in Karl Marx on the other. But the deepest basis of the socialist critique was the search for a more profound justice, not only formal but substantial, which would consider economic realities. The most extensive work ever devoted to the idea of justice, Proudhon's three-volume *De la justice dans la révolution et dans l'église*, proposes the socialization of the idea of justice itself and is thus linked through Fichte and Krause with the trend begun by Leibniz. It is by means of justice, according to Proudhon, that a conciliation is effected between the individual and the whole, which are equally real—a balancing of personal and transpersonal values, which are equally positive. Justice is at once objective and subjective, real and formal, or rather it transcends these opposites because it integrates individuals in a transpersonal, antihierarchical order, in which every individual maintains his own dignity precisely to the extent that he is an indispensable member of a community that cannot be reduced to the sum of its parts. Justice demands the realization of an order which is "neither communism, nor despotism, nor atomism, nor anarchy, but liberty in order and independence in unity." It is through "mutualism," the interplay of collaborative associations and their federations, through the humanization of property by its transformation into a social function in the hands of cooperative associations and, finally, through the counterbalancing of the state by organized economic society that justice can be best approximated. Such a justice is positive and dynamic; it secures with "certainty and fulness" everything which the older concept of justice merely permitted, and it takes account of industrial mobility and change.

Proudhon's conception of justice influenced equally the reformist socialism of Jaurès and the neoliberal doctrine of the French solidarists. It is true that in aiming to "bring back fraternity into justice" and to "render the social debt legal" the solidarists thought not so much of going beyond individualism and etatism as of rectifying "the applications of com-

mutative justice," bridging the gap between the solidarity of men and the actual inequality in their conditions. To apply this conception of justice requires first of all a "reestablishment of equivalence . . . a realignment in the positions of the various members of society," which may be effected by the state through social legislation, the protection of women and children, the progressive taxation of income and similar measures. An analogous position with regard to social justice was occupied by English neoliberalism of the end of the nineteenth century in demanding the establishment of "equality of opportunity" and a minimum standard of living. Before the advent of neoliberalism the utilitarian theory of John Stuart Mill, which valued justice as "the most important and the most privileged of social utilities," adhered nevertheless to an intransigent individualism, identifying justice with the affirmation of the liberty of every individual and making it thus irreconcilable with anything but a formal egalitarianism. Herbert Spencer presents an interesting contrast to Mill. The latter starting with an individualist philosophy arrived at a social theory of justice. Spencer starting with the principle of "integration by differentiation," which seemed not only capable of reconciling naturalistic evolutionism with the ideal of justice but also of rendering the latter social, arrived in reality at a conception of justice as individualist as that of Kant. His belief in the law of the "survival of the fittest" led him to fight any social policy which would aid those who were economically weak and dispossessed.

Juristic thought in the first decades of the twentieth century saw a revival of the idea of "natural law," movements for a "free" and a "living" law and the creation of new instruments of international law, especially the Permanent Court of International Justice. The movements in favor of a living law and the free inquiry of the judge must, however, be distinguished from the others. They revolve not so much around the question of justice proper as around that of equity, which consists in thoroughly appreciating the concrete case and in knowing how to individualize it—a process which Aristotle had already distinguished from justice.

The problem of justice arises only if the possibility is admitted of a conflict between equivalent moral values. Justice presupposes the existence of conflict: it is called upon to harmonize antinomies. In an order harmonized in

advance, in the community of the saints and angels, for example, justice is inapplicable and useless. But a simple conflict of forces is not sufficient: there must be a conflict between irreducible, positive and extratemporal values. Only the principle of the synthesis of individualism and universalism, which excludes any tendency to reduce the a priori values of the whole and of the individual the one to the other but which recognizes them as equivalent, can permit the problem of justice to be grasped in all its importance. It is only in the ideal realm of the moral that the synthesis of individualism and universalism premises a perfect harmony between personal and transpersonal values: in the actual world they are in fierce conflict. And it is precisely this gap between the harmony of the moral ideal and the disharmony of reality that gives rise to the problem of justice.

In the history of ideas justice and morality have been either identified, confused or too completely separated. Justice is an essential medium for the moral ideal, an a priori condition for its realization. It is its necessary *ambiance*; it shines with its reflected light; in its shelter alone the moral ideal may display its richly individualized and complex tissues. Inseparably bound up thus with the moral ideal, justice is nevertheless profoundly distinguished from it by its intrinsic structure, and it is precisely because of this difference in structure that it can play its role. Justice constitutes, as Fichte was the first to indicate clearly, a step in the rationalization of the moral ideal, which is in itself irrational (alogical). The moral ideal is accessible only through action, through a "volitive intuition," consisting in the participation on the transpersonal plane of pure creative activity, in which each must act in a manner absolutely dissimilar from that of all others, discovering by that very fact his place in the whole of creative activity. Justice cools the heat of the moral ideal by making it pass through a logical intermediary. It arrests the intuition-action and amalgamates it into a judgment. Justice is midway between morality and logic. The act to which justice presents itself is not the intuition-action itself but the "recognition" of its value. The recognition of a value is very different from the direct experiencing of it. One may, for example, be insufficiently endowed to grasp the aesthetic values of a symphony, but this does not at all prevent one from be-

coming indignant against whoever disturbs the quiet of the listeners. It is precisely to this act of the recognition of the moral ideal that justice applies itself, and the values which depend on it are consecutive to moral values. Through this act of recognition, strongly impregnated with intellectual elements and presenting the amalgam of a judgment and an action, the logicalization and the generalization of the irrational qualities of the moral ideal are achieved. In justice the general rule is substituted for the strictly individualized precepts of the moral ideal; common types are substituted for subjects not strictly comparable with each other; a certain schematic stability is substituted for creative movement; a quantitative element for the ensemble of pure qualities. It is precisely within the shelter of these boundaries of generality, of stability, of quantification, which are placed by justice at the service of the moral ideal, that the latter can display its creative force.

The relation between justice and the law is quite different from that between the moral ideal and empirical morality. It is much nearer to that between a logical category and the object constituted by that category. Justice plays the role of the Logos rather than of the ideal, of the law. The moral ideal is essentially opposed, inasmuch as it is unrealizable, to empirical morality and cannot be embodied in the latter; by its nature it can only exercise a "regulative" function with regard to the moral point of view. Justice, on the contrary, inasmuch as it is strongly impregnated with logical values, has the faculty of forming law directly: it does not oppose it so much as constitute it. Justice cannot serve as a basis of criticism and appreciation of the law because it is one of the elements of it.

It is but a consequence of the particularly complex position of justice as intermediary between the logical categories and the moral ideal that man has always attempted to do justice. Nevertheless, it would be false to identify justice with "natural law." This identification, which was admitted by only a few of the old theorists of the natural law, commits the triple error of placing justice on the same plane as the moral ideal, of pretending to deduce a body of law from this ideal and of identifying a juridical reality with the principle of its appreciation. If in general the existence of natural law could be admitted, it must in any case—as must also positive law—represent an

attempt to realize justice in a given social environment and must in consequence differ from justice itself. To deduce concrete law from justice is at bottom as great an impossibility as to deduce from a logical category the object which it constitutes; as sensation must intervene in the domain of perception, so in the domain of law there must intervene the resistance of the empirical social milieu.

Furthermore justice cannot serve as a criterion of appreciation and criticism of law for the reason that it is infinitely variable, the preliminary reconciliation between moral, personal and transpersonal values (which may themselves also be variable) being essentially mobile and changing according to place and time, while the moral ideal remains invariable in itself. It is not to the idea of justice but to morality that one must turn to discover the supreme criterion of a social and juridical policy. The true role of the idea of justice lies in its being the indispensable foundation of every scientific deduction of the general concept of law. In this sense the theory of justice is the essential prerequisite of a philosophy of law. From the character of justice as the logicalization of the moral ideal there results the fact that the law—the attempt to realize justice in a given social milieu—has a strictly determined and typical character; its requirements are limited and for that very reason the duties of some correspond to the claims of others. The structure of the law is thus multi-lateral and imperative-attributive, while the structure of morality is only imperative and unilateral, its requirements being infinite and strictly individualized. Thence follow the other differences between law and morality: the necessarily positive character of the rules of law, premising a guaranty of correspondence between the claims of some and the duties of others and thus making a purely autonomous law impossible; and also the presence in the law of the element of coercion, which is absolutely excluded from the moral domain.

JUSTICE, ADMINISTRATION OF. The province of judicial administration is nothing less than the law in action. The law of the books presents a theoretical system of legal precepts, courts, judges and modes of procedure. The course of judicial administration presents phenomena which cannot always be reconciled with the law of the books. In an age of legislation it might be supposed that this tendency to divergence would be less marked than in the age of fiction and equity, but the human factors in administration are as powerfully operative as ever. In fact this is worth comment only because of the wide belief that a government should be one of "laws, not men." Indeed it is somewhat confusing to speak of the administration of "justice." Justice as the goal of law is a philosophical idea which is capable abstractly of various formulations. The administration of justice is at least theoretically supposed to proceed according to the precepts of positive law. Modern juristic practise is dominated by the conception of "justice according to law." It is the traditional ideal of all western democratic legal systems. The law has had a long and difficult struggle against personal and executive justice. But the modern revival of the demand for administrative justice shows that the struggle is still unabated. Of course popular notions of justice have always had important impacts upon the judicial process even where there has been no direct lay participation through such an institution as the jury. The belief that even

trained judges merely disclose the law has been exploded by sociological jurisprudence. It is indeed the growing realization of the true nature of the judicial process that has been primarily responsible for the focusing of attention upon the course of judicial administration. As long as mechanical jurisprudence reigned, jurists confined themselves to the study of legal rules and doctrines. Judges did not "administer," they simply "declared" the law. What was supposed to be automatic hardly needed to be administered.

The judicial machinery of different western democratic countries shows considerable variation in particulars, but the leading objectives of their systems of judicial administration may all be derived fundamentally from the straining for justice according to law. Despite all the attacks of the exponents of realism legal systems still cling to the ideal of certainty. Granted that the judge who is unhampered by fixed legal precepts will not be influenced by improper motives, it is still argued that both individual rights and the public security will be better secured by limiting his powers of free decision. In all the affairs of life there is a striving against uncertainty, but an individual who enters into a legal transaction wishes particularly to know his rights in advance. Especially a system of private property demands certainty as a guaranty of the security of titles. The ideal of certainty thus involves the paradox of suppressing as far as possible the administrative elements of judicial administration. In other words, judicial administration must be characterized by a greater inflexibility than other branches of public administration.

Nothing can so undermine the certainty of justice as a lack of impartiality. Thus the integrity of the administration of justice has been elevated as an ideal. Moreover the insistence has been upon a superior degree of integrity as compared with other branches of administration. Judicial administration has been surrounded with special safeguards. The modern state has striven to achieve a legal justice that should be far superior to its economic justice. In large measure it has succeeded. A judicial scandal is considered especially deplorable. The slightest hint of irregularity or impropriety in the courts is a cause for great anxiety and alarm. A legislator or an administrator may be found guilty of corruption without apparently endangering the foundations of the state but a judge must keep himself absolutely above suspicion. To

speak of "the integrity of the administration of justice" has become almost a fetish. It has perhaps a more intensive existence in common law than in civil law jurisdictions, where the judiciary, since it is not an independent power in the state but a branch of the administration, is less exalted, but it exists everywhere in western countries.

The insistence upon the superior integrity of judicial administration is closely associated with another idea: the sublimity of justice. The administration of justice is considered not only as a function of the state but as something of a mystery. This is apparent from many familiar practises and sentiments. At least high courts of justice are everywhere required to be architecturally magnificent. A trial, particularly a criminal trial, is as much a rite as a judicial inquiry. The proceedings are arranged to impress both the participants and the spectators with the solemnity of the occasion, with the majesty of the administration of justice. Not only the vulgar but the enlightened still respond to the ritual with some feeling of awe.

The reasons for these peculiar attitudes toward judicial administration hark back to an early period in the history of the state, which established the primary importance of rendering justice between man and man. There is a persisting memory of the anarchy of the period of self-help. The early sacral affiliations of the administration of justice are also not forgotten. When the king asserted his power over warring and intractable nobles, justice was established as the very foundations of kingdoms. The common man now had some measure of relief against the aggressions of the mighty. In his gratitude he invested justice with special attributes of sanctity. For many centuries the state remained almost solely the policing state, and the administration of justice was the only public function it undertook in the interest of the common man. Legal justice was synonymous with social justice, and it was natural enough that it should be appreciated very highly. Today the state undertakes many administrative services, and the contact of the average citizen with the state is far more frequent through its administrative than its judicial agencies. The average man may pass through life without coming into contact with the judicial machinery of the state. But it is still considered far less calamitous to have to pay a bribe for an occupational license than to be denied justice in the courts.

The state has gone a long way in preempting the field of judicial administration but it has not yet gone the whole way. In all western countries the sphere of judicial administration is still divided into two branches, the one civil and the other criminal. They have many points of contact, for the same injury may be the basis not only of civil relief but of criminal prosecution. Indeed in many continental countries by virtue of a so-called process of adhesion civil relief may be sought as part of a criminal prosecution. But the civil branch of judicial administration generally differs from the criminal in its problems and approach. The differences are formally expressed in the distinction that civil is "private" while criminal is "public" law. This is only to say that the interference of the state is not as direct and extensive in both branches. In the criminal law the interest of the state in the public security has practically eliminated all vestiges of the system of private composition. Both American states and continental countries have given to public prosecution at least a practical monopoly of criminal administration. The individual may complain but only the public prosecutor may actually initiate a prosecution. The important exception among western countries is England, where any private individual may begin a public prosecution, but even in England a director of public prosecution has been established to take action in the case of most major crimes.

In the administration of the civil law, where the stake is not the public security but individual interests, the state has traditionally maintained an attitude which has been described as one of benevolent neutrality. The state is there with its judicial machinery but it is for the private parties to invoke its aid. It will not ordinarily act upon its own motion. Even when a civil action has been commenced the parties retain control of its subsequent course. They may compromise or abandon it at any stage of the litigation. To a greater or lesser extent they have been permitted even to vary the steps of the legal procedure. To be sure, the state is now prepared to take direct measures of coercion against recalcitrant parties to a civil suit. It has gone beyond the indirect and elaborate process of outlawry which in primitive law in the absence of the idea of judgment by default was necessary to make a contumacious defendant answer. It no longer requires judgment "promise" before it will issue execution, although where contempt procedure alone is available the

situation is fundamentally not very different. But its general attitude toward civil suits shows plainly that it has never completely abandoned the ancient tradition of self-help.

The two great legal systems of the western world, the common law and the civil law, are formally organized upon different bases. Judicial administration has traditionally been said to be more highly centralized in civil than in common law countries. In continental countries the control of judicial administration has been vested in a ministry of justice which is charged with supervising the whole judicial machinery of the state. The minister of justice is a member of the cabinet and thus closely associated with the policies of the government. He is the liaison officer between the courts and the administration. The doctrine of the separation of powers has never in continental countries been pushed to the extent of making the judicial department a distinct department of government. It is simply a branch of the executive. The ministry of justice is thus not only a judicial but an executive department of government. Judicial administration thus retains something of a Byzantine cast in the countries which are the heirs of the Roman tradition.

The United States has usually been held up as an example of the opposite extreme. Here the English doctrine of the separation of powers has been adopted in such a constitutional form as actually to make the courts supreme rather than the law. The doctrine of the separation of powers has been interpreted in such a way as to make the judiciary an independent department of government which is supposed to be equal and coordinate with the other departments of government.

To be sure, American states now have an officer called the attorney general, but in reality he exercises little or no control over the judicial administration of the state. Theoretically he may have the power to intervene in criminal cases, but practically criminal prosecutions are so much in the hands of local district attorneys that he is quite helpless. Only in a few states, such as Iowa, Indiana, Nebraska and South Dakota, can the attorney general attempt to oust local prosecuting officials, but even there he can do so only through proceedings in the courts. Of course he cannot remove or transfer judges. The attorney general is simply the legal adviser of the governor and represents the state government when it is a party in civil cases. Moreover in such functions as he discharges he is as a

popularly elected official beyond the control of the state governor.

The organization of judicial administration in the federal government is somewhat more centralized than in the states. There has been a Department of Justice in the federal government since 1870. At its head is the attorney general of the United States. It actually controls the United States attorneys throughout the whole country who are charged with the administration of the criminal law. Its agents engage in criminal investigation. The work of criminal investigation and prosecution is thus coordinated. Over the judicial hierarchy of course the Department of Justice has no powers, and the attorney general unlike the continental minister of justice plays no part in securing legislation relating to judicial administration.

It is usual to say that in England there is no ministry of justice. It is fair to say, however, that it exists in all but name. As is so often the case in England the needed institution has been approximated without being formally created. The functions of a minister of justice are divided between the law officers of the crown, the director of public prosecutions, the home secretary and the lord chancellor. The two latter are particularly important as ministerial officers. The home secretary controls pardons, supervises the police system and the prison system, appoints all "stipendiary" magistrates and the local criminal judges called recorders and approves of circuit arrangements for the local judges. Even more important is the lord chancellor, who is a member of the cabinet and who since the Judicature Acts has been not so much a judge as an executive and legislative official. As a member of the cabinet he frames measures of a legal character; as an executive officer he appoints judges and supervises the entire court system; and as a judge he presides over the high courts.

As soon as one turns from the general objectives and organization of judicial administration to its results, the existence of a constant dissatisfaction is discovered. Complaints of the perversion of the administration of justice are practically as old as attempts to enforce legal rights. Since there has probably never been a truly static society, a complete complacency with any human institution is not to be expected. But complaints against the courts have been of particularly great volume and intensity. Any familiar book of quotations will more than prove the point. Legal reforms have been more or less

frequent but abuses have persisted. A tabulation of the very frequency of the reforms will show the constancy of the discontent. It is expressed in terms which are familiar enough.

One of them at least, "the law's delay," is classic. It has served to describe the almost immemorial condition of civil suits. The dockets, or calendars, of civil causes are always overcrowded, and it may take years to get a trial on the merits. The expense of commencing a civil action and the legal costs involved are too great, and it becomes hardly worth while to base an action on a small claim. The procedure is too elaborate and technicalities impede the litigant at every stage. Even after an initial judgment appeals may be a further cause of delay. Where the final judgment is secured, execution is more than likely to be returned unsatisfied. Under such circumstances the honest litigant is impeded in the assertion of his legal rights, while paradoxically enough the dishonest litigant is encouraged to assert unfounded or exaggerated claims. The very expense of engaging upon a protracted litigation will cause parties to settle for smaller sums.

Delay and technicality are operative not alone in civil actions. But other and more serious charges have been brought against the administration of criminal justice. In the predemocratic era the arbitrary character of criminal justice led to accusations of excessive harshness, while at present the outcry is against an excessive tenderness toward malefactors. Many criminals are never even apprehended. Those who are have more than an even chance to escape by taking advantage of the loopholes of the law. The inherent drama of a criminal trial in the very nature of things always favors the defense. As a result of newspaper exploitation a criminal trial often becomes a public orgy. Except in matrimonial actions and libel cases a civil trial is usually free of such influences. On the other hand, corruption, favoritism and perjury are especially operative in criminal trials. Class and race bias make disinterestedness and objectivity difficult and cause miscarriages of justice. Every period has its own *cause célèbre*. It is a frequently heard commonplace that wealthy and powerful malefactors escape while the poor and friendless go to jail. Innocent men are sometimes "framed" by the police; and it is small comfort that the same technique is employed to get professional criminals behind the bars upon fabricated charges.

Popular dissatisfaction with the administra-

tion of justice has certainly not been less in the twentieth than in previous centuries. A period of particularly accelerated tempo, it would seem easy to explain the prevailing dissatisfaction in terms of institutional transitions. If, however, the phenomenon is constant it can hardly be explained entirely as the result of changing conditions. An explanation solely in terms of sociological differentials can be adequate only if more fundamental factors are absent. It is, for instance, tempting to assign the prevalence of perjury, which so often in modern courts undermines the administration of justice, entirely to the decline in influence of religious ideas. But perjury has always been a not infrequent crime. It should certainly be no less powerful a restraint to fear the punishments of this world than to fear the torments of the next. Authority has maintained itself somehow despite the decay of religious institutions. To take another stock illustration, the vast improvement in means of communication has undoubtedly given the criminal facile means to attempt escape but the advantage is balanced by the ease with which public authorities may pursue him. There is again the pernicious influence of the modern city. To it is attributed the congestion of the courts which is supposed to be the very basis of the modern maladministration of justice. But mere size can hardly account for the evils of metropolitan justice. As a matter of fact the city has been the originator of most of the improvements of procedure in the history of legal systems. If there are more litigants in the city, it has the necessary wealth to secure additional judges.

A great deal has been heard about the breakdown of justice in the United States. Many special causes have been assigned for the state of affairs. They have been repeated often enough to have become stereotyped. Both Puritanism and the pioneer tradition have been blamed for that intractableness of the American population which makes law enforcement difficult. The suspicion of the magistrate which is supposed to have characterized Puritanism is held to be responsible for multiplying the technicalities of procedure; although in the middle of the nineteenth century, when Puritanism was certainly far less remote than it is now, a puritanical American state legislature introduced a system of code pleading which if it had not been perverted by a process of judicial interpretation according to common law tradition would have gone far toward inaugurating a system of pro-

cedure much in advance of the times. Curiously the pioneer too is accused of favoring the proliferation of elaborate procedural devices because of his distrust of the courts. Yet the pioneer at the same time is supposed to have been an exponent of rough and ready justice. Certainly both Puritan and pioneer attitudes are hardly living forces in the American scene of the twentieth century. They were never more than extreme forms of individualism. At any rate the reforms of procedure in the last few decades have been so many that the worst features of the old system can hardly be said to survive. A disposition to be patient with technicalities is not a particularly distinguishing feature of American courts today. Appeals have been greatly curtailed; the sanctity of jury trial in civil cases has been undermined by such a device as the summary judgment; and all sorts of special civil and criminal courts have been erected to care for various special types of litigation, such as domestic relations, juvenile, small claims and municipal courts.

Nevertheless, it is continually asserted that the evils of American judicial administration are primarily due to the failure to "adapt" eighteenth century English institutions to American conditions. The vast superiority of English to American criminal administration makes the charge particularly plausible. Such an explanation is almost inevitable in any country which at one time was engaged in a process of reception of another legal system. Similar complaints of lack of adaptation have been heard in the countries which have received the Roman law. Undoubtedly in the initial stage of reception the receiving legal system is likely to lag behind its model. But for that very reason it is likely in succeeding stages to be even more independent. Generally speaking, legal reception involves much the same problem as cultural diffusion. The institutions of the receiving legal system are apt to be native inventions with foreign externals, often only half understood. As good an example as any is the way the English "rule of law" became American constitutionalism. As a matter of fact American law was making striking departures from English models throughout its history, as the many technical differences between the English and American common law systems show. Even the official dogma was that English law was to be received only in so far as it was suitable to American conditions. Thus in such a matter as debt American law from a very early period

favoured the creditor class to a far lesser degree than English law. In the organization of American courts the peculiar English structure of conflicting and overlapping jurisdictions, the result of a great variety of historical accidents, was to a large extent avoided, and it may be said indeed that the more logical American hierarchy of courts showed French influence more plainly than English. Particularly in the criminal law did American legal institutions depart radically from the English models. American law followed European at a much earlier date than English law in introducing the public prosecutor. Until the establishment of the office of director of public prosecution in England in the last quarter of the nineteenth century England still maintained the mediaeval theory of private prosecution. In any event the insistence upon "failure of adaptation" wrongly assumes that the English institutions of the eighteenth century were adapted to the conditions of the motherland at the time.

The conventional division of western law into "common" and "civil" law systems has also encouraged ready explanations of the comparative quality of their results in terms not only of sociological but of technical differences. These certainly were fairly marked in the earlier centuries of their history. But the political centralization which is necessary to the establishment of efficient national legal systems, and which was early achieved in England, has also been accomplished in continental countries. The English constitutional struggles of the sixteenth and seventeenth centuries have had their later counterparts in the democratization of other western countries. The rule of law is not now the exclusive glory of the common law. The establishment of administrative courts in continental countries has brought at least as great a degree of protection of individual rights against the arbitrary encroachments of government as it is possible now to achieve in England by virtue of the immemorial prerogative writs. Without doubt American constitutionalism goes further in favor of individualism, but the doctrine of judicial review is not now an exclusively common law institution, since the right to review legislative acts has also been established in some European countries although it may constitute a less rigid form of control there because of the existence of other factors, such as the greater ease of reversing an unpopular constitutional decision by constitutional amendment and the lesser exaltation of the

position of the judiciary. It must be remembered that in all modern countries the judiciary exercises an undue power in the state by virtue of ordinary powers of judicial interpretation. While the technology of the private law in common and civil law jurisdictions differs considerably, in all western countries they have the same purpose of protecting the institutions of property and contract. Nevertheless, even technologically there are many similarities. The common law can boast the doctrine of consideration but in the civil law may be found the analogue of *causa*.

The substantive law of crimes and punishments in all western countries has a remarkable degree of similarity. As far as criminal procedure is concerned a great deal is still made of the difference between the continental "inquisitorial" as opposed to the Anglo-American "accusatorial" system. Even in the heyday of the classic common law the distinction was not completely justified. The English justice of the peace for some centuries exercised inquisitorial as well as judicial powers. The English court of Star Chamber was hardly an accusatorial institution. Down at least until the Restoration the English practise of an unrestrained and running fire of cross examination by the judges was hardly better than the continental practise of systematic interrogation. Any intimate acquaintance with modern continental criminal procedure will show that there is no longer any basis for the old scholastic distinction. Everywhere the rights of confrontation and publicity are recognized. Private prosecution was a feature of the accusatorial system, but all western countries provide for the institution of the public prosecutor in one form or another. The introduction of the jury into continental countries in the nineteenth century for the trial of major crimes greatly modified the inquisitorial system. It is true that the jury is now on the decline in some continental countries but so it is also in both England and the United States, in the former country as the result of the development of "summary" prosecution, in the latter as the result of the district attorneys' legal or administrative powers of bargaining. As a matter of history the praise of the jury system usually overlooked the devices developed by the judges for its control and above all the effect of its middle class constitution. Besides in the United States the use of the injunction in essentially criminal cases may be cited as a notable example of a funda-

mentally inquisitorial procedure. To this may be added the practise of the "third degree" by the police. As in the Middle Ages the strictness of the rules of proof has led inevitably to the use of torture. Again, it is frequently said that the "local" basis of prosecution in common law jurisdictions, which in its prime made it impossible to prosecute a criminal for a transitory crime, makes it easy for a criminal to escape by crossing territorial lines. In England, however, the local basis of prosecution has been all but eliminated by twentieth century legislation and it has been to a large extent curtailed in the United States by the reception of early English statutes. Everywhere the institutions of extradition and interstate rendition have gone far toward making criminal pursuit international.

The examples may be multiplied almost indefinitely. Each system has its technical virtues and defects but it seems very probable that a rough balance is produced in the general result. It is particularly difficult to understand foreign legal doctrines. But since the course of the administration in foreign countries is even more difficult to follow than the law of the books, it is easy to romanticize the operation of a foreign system. Indeed its defects often recommend themselves to the native observer as positive virtues to be emulated. If cultural values and institutional fundamentals are assumed to be very similar in most western countries, it becomes hard to believe that the effects of variations of juristic technique will not largely be minimized in the actual course of administration.

A universal rather than a particularistic mode of approach explains a great many of the defects of judicial administration. Litigiousness is a strong characteristic of human nature. All over the world a forensic display attracts the admiration of the multitudes. Curiously legal technicalities are despised at the same time that their ingenuity is applauded. Disappointed litigants are not always silent. In their defeat they appeal from "law" to "justice." Lawyers as a class have too much to gain from maintaining the intricacies of their art to simplify it to the extent which would make their services unnecessary. For many reasons legal institutions lag behind changes of public opinion much more than do other institutions.

It seems almost as if the great western tradition of justice according to law has almost inherent and fateful difficulties. The great con-

cern for the security of individual property demands a considerable formalism in civil procedure. The tendency is for it to run rather to excess. It is true that a civil suit of major consequence in the present century may be completed in a year or two or even less, whereas a few centuries ago it might have taken a decade or two or even more. But before it is concluded that a great improvement has taken place the differences of pace of the respective periods must be taken into account. Again justice according to law tends to strain toward equality. The procedure of the law is devised to deal with all claims upon the same basis. But that basis is the degree of protection necessary for interests of substantial magnitude. To be sure, as the pressure for real equality has made itself felt special procedures or courts have been invented to secure the enforcement of minor claims in a more or less summary fashion. But often the procedure is still too formidable for the size of the economic stake involved. Again, justice according to law demands that the justice of the state be exclusive. The pluralistic competing associations are suppressed with the result that controversies which might have been adjusted quite readily in the intimacy of the group are handled by the state with elaborate delay. The state, which is a stranger to the group, can necessarily proceed only with great caution. It may accept the rules of the group but its procedure will always be its own. A ready example is the perversion of the law merchant in all mature legal systems. Finally, justice according to law demands that legal rules be applied as mechanically as possible. Discretion is considered dangerous. A rule is sometimes selected not because it is the best but because it is easiest to apply. A judgment is often given not because it works justice in the particular case but because it is considered unwise to relax a general rule.

It would be easy enough to overcome the almost inevitable inefficiency of justice according to law. But far reaching changes are certainly impossible while the regime of individualism upon which the prevailing ideal is based is considered desirable. As long as the interest in individual security is preferred to the interest in the general security both civil and criminal justice must remain "inefficient" to a large extent. Those who speak of judicial inefficiency are usually unaware of the highly artificial meaning of the conception. The law is efficient in civil suits when it enters judg-

ment and issues execution as expeditiously as possible. Thereafter its efficiency ceases to be the primary consideration. As a result of the humanitarianism which is the necessary corollary of the regnant individualism a whole series of obstacles arises in the enforcement of execution. The property of the debtor is often put beyond the reach of the creditor either by the procedural delays which make it possible for the debtor to transfer it or by formal exemptions from execution. The person of the debtor is of course beyond seizure. In this respect the law of previous centuries, which more frequently recognized rights of provisional arrest and imprisonment for debt, was certainly more "efficient." But a return to the older law will hardly recommend itself now. In any event there would still remain the economic poverty of the debtor to defeat the efficiency of the law, and it is safe to venture that the latter would be blamed exclusively for every miscarriage of justice. In the criminal law the situation is somewhat reversed. Once judgment against a malefactor is obtained it is much more certain to be executed. But the concern for the individual is manifest in the procedure to judgment. The provisions are not only considered procedural safeguards but are great constitutional rights. They are indeed constitutional rights which have been won only after many centuries of bloodshed and in no western democracy would their abandonment be seriously considered. The almost insoluble dilemma is that they benefit not only the ordinary citizen who occasionally finds himself in the toils of the law but the professional criminal, who by long experience has learned to take advantage of all its defenses.

Although the law has constantly oscillated between concern for the individual and for the general security, the perfect balance has probably never been struck. As one extreme is reached there is a reaction toward the opposite extreme. At present after a century of individualism there is an insistent demand for socialization. In the criminal law it has shown itself in a rather vague demand for a "preventive" criminal justice. In the private law it has led to proposals to make the state assume through some public officer the direct burden of administering civil justice. Less radical proposals look merely toward the establishment of state legal aid bureaus. Here and there within recent decades the conception has begun to penetrate that even civil procedure should be regarded as

public or beyond the control of private parties. But on the whole the movement for "socialization" can hardly have very much success as long as the more fundamental social institutions remain largely unaffected. It is difficult to see the possibility of introducing a monopoly of civil justice as long as private rights are recognized. Most of those who favor such a scheme hardly realize its extreme economic radicalism.

To be sure, individualism is not to the same extent the basis of the social order in all western democracies. Many compromises have been made here and there which have had beneficial effects upon the quality of judicial administration. Special conditions have sometimes accounted for peculiar results. In imperial Germany the pride of a judicial oligarchy was the cause of a period of storm and stress which inaugurated the so-called free law movement. In post-war Germany the country seethed with political murder. South American countries are usually democracies only in name, and dictatorship has far reaching effects upon the administration of justice. The considerable variation in the political systems of different countries has had a particularly marked impact upon their criminal justice. The political institutions of a country constitute its fundamental technique of human relations, of which the criminal law is only a part. It is to the corruption of the American political system rather than to either Puritanism or the pioneer tradition that the reputed inferiority of American criminal justice is to be traced.

Since it is difficult to secure radical alteration of fundamental social institutions, the reform of judicial administration usually concerns itself with adjustments of the judicial machinery. Reforms of procedure are far more frequent than changes of substantive law. Perhaps that is one of the reasons why the results frequently leave so much to be desired. It is true that the distinction between substantive law and procedure is artificial. All reforms of procedure effect substantive rights but certainly they cannot improve the situation where the substantive right is of a dubious character. In general the creation of new courts or the appointment of additional judges to existing courts is a very frequent expedient in reform. Its popularity with politicians arises from the fact that it increases their patronage by providing new offices to fill. Changes in steps in procedure often have the curious result of increasing the congestion of the courts for at least a time. A great deal of

litigation is often necessary to settle their effect. The fundamental puzzle of procedural reform is the indispensability of any one particular device. Since legal technique permits of a considerable degree of variance for the accomplishment of similar ends, it can be said that almost any form of procedure reasonably adapted to secure the fundamental purposes of the law will work if there is the will to make it work.

Of particular reforms of procedure it is impossible here to speak. But as far as the general organization of judicial administration is concerned there has been a great deal of agitation in recent years in both England and the United States for the establishment of ministries of justice upon the continental model. It is very much to be doubted, however, that they would inaugurate a profound change in the direction of judicial administration. Since in England the functions that could be discharged by a ministry of justice are already discharged by several existing officials, the movement for it is intelligible only as one for consolidation of their powers. In the United States a good deal of supervision of judicial administration takes place through such semi-official organizations as the bar associations, which are consulted in the appointment of judges, which draft legislation relating to judicial administration and which in general exercise a good deal of supervision over lawyers, judges and courts. Complaints of the maladministration of justice have been so frequent in the United States that they can hardly be said to be secrets which need to be revealed to the ignorant legislatures by ministers of justice. As for the control of the courts themselves, the great independence of the American judiciary really makes it impossible. Even the shifting of judges from one district to another as they are needed can take place only within limits. Moreover in the prevailing enthusiasm it is overlooked that the supervisory powers of even the continental ministry of justice have been undermined in recent decades by the introduction of guaranties of judicial independence. Thus a centralizing agency is urged that has been decentralized to a considerable extent in the countries of its origin. Moreover there can never be a real organic unity of organization in the administration of justice as long as there survives a disunity of procedure in civil and criminal matters. Even where the ministry of justice exists civil justice does not receive the same degree of oversight as criminal justice. It is forgotten too that at

least as far as civil procedure is concerned the courts in a considerable number of American states no longer need an agency to secure relief for them from the legislatures. In the last two decades a movement to follow English practise in giving rule making powers to the courts to enable them to control procedure has secured legislative approval in Alabama, Colorado, Delaware, Michigan, New Jersey, North Dakota, Vermont, Virginia, Washington and Wisconsin. Curiously the courts in almost all of these states have made little use of their rule making powers.

While no American jurisdiction has established a ministry of justice, a great many have established bodies known as "judicial councils" in imitation of the judicial council provided for in England upon the consolidation of the courts under the Judicature Acts. Judicial councils exist at present in California, Connecticut, Idaho, Illinois, Kansas, Kentucky, Maryland, Massachusetts, Michigan, New Jersey, North Carolina, North Dakota, Ohio, Oregon, Rhode Island, Texas, Utah, Virginia, Washington, Wisconsin. These councils have in general been made not directive but investigative agencies, and there is little evidence that they are much more than paper institutions. At the most they have produced only a few reports. In England the inactivity of the judicial council of the Supreme Court has been the subject of comment. A federal council, or conference, of senior circuit judges established in 1922 has been more successful. It meets annually to consider the problems of judicial administration in the federal courts. Unlike the state judicial councils it has the important power of transferring judges to various districts where they are needed because of the pressure of judicial business. The right to transfer judges also exists in other American courts, such as unified municipal courts.

The agitation for American ministries of justice is closely connected with plans for laying the foundations of an adequate science of judicial statistics. At present judicial statistics are almost entirely criminal statistics. In continental countries the ministry of justice and in England the office of the lord chancellor publish civil statistics, but generally speaking they relate only to the volume of judicial business and the pace of procedure. As far as the subjects of litigation are concerned only such matters as divorce and bankruptcy are reported with any degree of adequacy. Divorce and bank-

ruptcy statistics are often available also in the United States, where they are reported either by governmental departments or voluntary associations, but for the rest not even the European standard has been maintained. Until very recently there were few statistical reports relating to the civil business of the courts, and no more than a beginning is represented by the civil statistical surveys in Ohio, New York and Maryland which are now being encouraged by the Institute for the Study of the Law at Johns Hopkins University. A few of the reports of the state judicial councils have also been of some value.

Civil judicial statistics, if their compilation can be kept dissociated from particular programs of reform, are bound to prove interesting if not helpful, but certainly too much is not to be expected in the way of palpable results, at least not as far as the immediate future is concerned. Civil statistics are bound to be far less reliable than criminal statistics have proved. It must be remembered again that in civil matters the state does not press to discover when a wrong has been committed. In the attempt to use civil judicial statistics to follow social trends many complicated factors must necessarily be encountered. An increase of complaints may be traced back to an increase in legal transactions rather than to more frequent attempts to escape payment. Again, an increase of complaints may be due not only to economic depression but to a boom psychology which has led debtors to overreach themselves in taking advantage of easy credit. Such factors must be considered even in using civil statistics for the simple purpose of regulating the business of the courts. Despite the availability of statistics it must still remain very difficult to evaluate the effect of a particular procedural reform.

The ultimate test of a system of judicial administration is the extent of the civil controversies and the public crimes which it prevents by its mere existence. On the other hand, it must be remembered that men discharge their civil obligations and abstain from crime not only from fear of legal sanctions but also from moral and practical considerations. The modern tendency is certainly to stress other forms of social control. Finally, it must be realized that even the defects of the administration of justice, at least in civil matters, may have some social value in discouraging litigation, in impelling men to exhaust the possibilities of conciliation.

In an acquisitive society it is perhaps desirable that the paths of litigation be strewn with a few thorns.

Consult: A bibliography of judicial administration would repeat for the most part the references under various legal topics. The reader should consult especially the bibliographies of such central articles as JUSTICE; LAW; COURTS; JUDICIARY; PUBLIC PROSECUTION; PROCEDURE, LEGAL. The references under JURISPRUDENCE will show the juristic forms of approach toward the general problems of judicial administration. The works of the sociological school will be found to be particularly preoccupied with the law from the point of view of administration. For the quality of judicial administration in any particular country, its standard legal histories should be consulted. Occasionally there are very illuminating works dealing with a particular period. Thus the works of Ernst Fuchs give an intimate picture of justice in imperial Germany. J. W. Hedemann's *Reichsgericht und Wirtschaftsrecht*, Jena, Universität, Institut für Wirtschaftsrecht, Schriften, vol. 8 (Jena 1929) is especially valuable in showing the manner in which the highest court in Germany adjusted legal rights and interests in the post-war inflationary period. In the United States the most prolific writer upon judicial administration has been Dean Roscoe Pound. He recognizes the difficulties which are inherent in justice according to law but on the whole represents the point of view that the maladministration of justice in the United States is due to the failure properly to adapt early English legal institutions to twentieth century American conditions. See some of Pound's articles: "The Causes of Popular Dissatisfaction with the Administration of Justice" in *American Law Review*, vol. xl (1906) 729-49, "The Administration of Justice in the Modern City" in *Harvard Law Review*, vol. xxvi (1912-13) 302-28, and "Justice According to Law" in *Columbia Law Review*, vol. xiii (1913) 696-713, and vol. xiv (1914) 1-26, and 103-21; also his books: *The Spirit of the Common Law* (Boston 1921) and *Criminal Justice in America* (New York 1930). In connection with the movement to establish ministries of justice in the United States see: Cardozo, B. N., "A Ministry of Justice" in *Harvard Law Review*, vol. xxxv (1921-22) 113-26; Glueck, S., "Ministry of Justice and the Problem of Crime" in *American Review*, vol. iv (1926) 139-56; Edwards, J. Glenn, "The Ministry of Justice in France," and Jenkins, W. S., "A Ministry of Justice in England" in *North Carolina Law Review*, vol. viii (1930) 328-40. For the status of judicial statistics in continental countries see: Hesse, A., "Justizstatistik" in *Handwörterbuch der Staatswissenschaften*, vol. v (4th ed. Jena 1923) p. 537-42. For American judicial statistics: Marshall, L. C., "The Beginnings of Judicial Statistics" in American Statistical Association, Committee on Social Statistics, *Statistics in Social Studies*, ed. by S. A. Rice (Philadelphia 1930) ch. vii. A bibliography of the literature on the judicial council movement in the United States and the rule mak-

ing powers of American courts is found in Willoughby, W. F., *Principles of Judicial Administration* (Washington 1929) p. 607-52.

JUSTICE OF THE PEACE. The office of justice of the peace represents one of the oldest and most celebrated of English institutions. By virtue of this office the process of governmental centralization was finally completed in England. The last of the remaining old local courts or officials—the hundred, the tourn and particularly the sheriff, who was virtually the ruler of his county—were gradually displaced. But the new justice of the peace was no paid royal emissary. Although appointed by the king and subject to the control of the king's council or courts he was a member of the local landed gentry, whose services very soon came to be entirely honorary. Thus a balance was struck between the necessities of centralization and local self-government, and it was precisely this balance which gave the office of justice of the peace its strength and importance. The office brought English noblemen and gentlemen into contact with the common people of the realm. They became trained in the affairs of government and in the administration of justice. This training produced great efficiency in many justices who later became members of Parliament and had no little effect in determining the final supremacy of the lawmaking body of England. In the seventeenth century Coke declared that the office of the justice of the peace was "such a form of subordinate government for the tranquility and quiet of the realm, as no part of the Christian world hath the like, if the same be duly executed" (*Fourth Institute*, ch. xxxi, p. 170).

Perhaps the forerunner of the justice of the peace may be detected as early as 1195, when the justiciar, the principal minister of state and direct representative of the king, issued a proclamation to the effect that certain knights nominated for the purpose were to take an oath from all aged fifteen years and upward to aid in the preservation of the peace. In any event the justice of the peace can be readily traced from the reign of King Edward III. By statute in the year 1327 this monarch attempted to make his position secure by assigning certain well qualified men in each county of the realm to act as conservators of the peace.

The institution of justice of the peace may be said to date from the year 1360, when the statute 34 Edw. III, c. 1, appointed "one lord, and with him three or four of the most worthy in the county, with some learned in the law" to keep

the peace and try felonies and trespasses at the king's suit. But this authority obtained only when two or more of these officials acted together. From now on they became known as justices and very soon thereafter reference was made to them as "justices of the peace" in the statute 36 Edw. III, c. 12 (1362).

From time to time the powers and duties of the justices of the peace were enlarged, until they became the most important factors in administering local governmental affairs in England. In truth for some three centuries they were the virtual rulers of the county, exercising not only the functions of the sheriff of an earlier day but participating in almost all the multifarious functions of the developing English state, including police, administrative and judicial functions. The last were primarily of a criminal character, for the civil jurisdiction of the justices has always been extremely limited.

After the middle of the nineteenth century many fundamental changes began to be made in the office of the justice of the peace. When a general county constabulary was established in 1856 (19 & 20 Vict., c. 69), the justices abandoned the role of police officials. A series of acts after the early decades of the century had already deprived them of some important administrative functions, and they lost most of the remaining ones when the County Councils were established in 1888 (51 & 52 Vict., c. 41, §§ 1-30) and the Parish and District Councils in 1894 (56 & 57 Vict., c. 73). Moreover the office of a justice is not now always honorary. Legislation has also made it possible for municipal boroughs and urban districts to secure the appointment of paid professional magistrates by petitioning the home secretary. These are the so-called stipendiary magistrates. The metropolitan police magistrates of Greater London are all stipendiaries. Finally in 1906 came the abolition of the property qualifications for justices of the peace (6 Edw. VII, c. 16), which had been £20 a year from 1439 (18 Henry VI, c. 11) to 1732 and £100 a year thereafter (5 Geo. II, c. 18).

The courts held by justices of the peace are still called Quarter Sessions and Petty Sessions. The Quarter Sessions are the sittings of the justices which take place quarterly, although adjourned sessions may often be held at other times. The sessions for divisions of the county are the Petty Sessions. Two or more justices are required to constitute a court unless the magistrate is a stipendiary. The court of Quarter Sessions has very broad powers: it not only tries

persons who have been indicted but makes presentments, and it exercises both original and appellate jurisdiction in civil as well as criminal cases. Originally the Quarter Sessions had jurisdiction to try nearly all criminal cases except those involving treason. But custom and statutes have removed from their jurisdiction cases involving murder and felonies punishable by life imprisonment and certain other specified offenses which usually involve difficult questions of law, although they still try cases of burglary. In the Petty Sessions the justices have summary jurisdiction over a great variety of criminal offenses of a petty nature.

Justices of the peace still act as committing magistrates. The preliminary examinations now held by them have their origin in statutes enacted in the reign of William and Mary. In the beginning the examinations were inquisitorial in nature but ceased to be so in 1848 (11 & 12 Vict., c. 42-43). The Criminal Justice Act of 1925 (15 & 16 Geo. V, c. 86, § 31) extended the powers of justices of the peace in the issue of process. Their process now runs to any county in England or Wales either to effectuate arrest or to compel appearance.

Thus the justices of the peace have become agents for the enforcement primarily of the criminal law. The lay justices had given way as they proved unequal to the task of ministering to all the complex needs of the modern state. The outcome has been much the same in the United States, where the office of the justice of the peace was one of the first instrumentalities of government which was created by the American colonists.

It was provided for by statute in Massachusetts as early as 1630, and the institution was flourishing in most of the colonies before the revolution. The principal function of the early justice was to maintain order. This was done by the exercise of criminal jurisdiction, which in some colonies was limited to specific offenses and in others was expressly made coextensive with the jurisdiction of the English justice of the peace.

The American justice of the peace has generally exercised a more extensive civil jurisdiction than the English justice. Before 1700 the colonial justice began to exercise jurisdiction in civil causes. In 1692 Massachusetts Bay Colony authorized the justice to hear, try and adjudge all manner of debts, trespasses and other matters involving in controversy a value not exceeding forty shillings. In Virginia his civil jurisdiction extended to con-

trousers involving "one hoghead of tobacco not exceeding 350 pounds." In addition to his duties concerning criminal and civil matters the colonial justice also performed numerous administrative functions. Among these were the taking of acknowledgments, the performance of marriage ceremonies and the taking of depositions.

The colonial justice of the peace was an officer of considerable standing. Within the scope of his territorial jurisdiction he seems to have been the *ne plus ultra* of local authority. The execution of the powers given him influenced not only the political, social and economic life of the community but the private lives of the individual citizens. That he was recognized as an important local official and occupied a high place in the minds of the people of colonial America is evidenced by the fact that the office by either statutory or constitutional provision has become a part of the judicial system of every state of the union.

But the justice of the peace of today is not the justice of colonial days, although in many state statutes he is still designated "conservator of the peace." Much of the criminal jurisdiction which he exercised has been withdrawn. He may try only certain misdemeanor cases, punishment for which is specifically limited in both the amount of fine and the term of imprisonment. The justice of the peace is more important, however, in his capacity as a committing magistrate. In this capacity he has authority to issue warrants for the apprehension and arrest of persons charged with the commission of public offenses, both felonies and misdemeanors. As magistrate he may hold preliminary hearings, reduce testimony to writing, discharge the accused or remand him to jail and fix bail. His administrative duties have not materially changed. In his civil jurisdiction he is limited by the amount of money claimed or the monetary value of the thing in controversy. In most states this amount varies from one hundred to three hundred dollars. Within that monetary limitation the variety of cases which the justice may hear and determine is very large.

The justice of the peace today is almost invariably an elective officer. His term of office varies from one to seven years. The usual term is two years. His compensation generally consists of fees paid by the party losing in the litigation. The statutes, beyond requiring the candidate for justice of the peace to be a resident, elector, voter or citizen, are silent on the subject of qualifica-

tions. The result is that the justice is usually a layman.

In the early days of the republic and during the settlement and carving out of new states on the western frontier the population was sparse and the power of government was decentralized. There were then few laws and fewer lawyers. In such pioneer communities protection and stability depended upon the quality of the man who administered the rules of society rather than upon the rules themselves. The justice was usually a man in whom the community had confidence. He was well known and was chosen because of his native ability, sound judgment and integrity. "Rough and ready" justice was necessary, and it was meted out fearlessly. Cases were few, and the trying of them was but an incident to the justice's principal business of making a livelihood. In that atmosphere the office of justice of the peace was a strong social institution.

Today, however, the American population, instead of living in backwoods agricultural communities enjoying a simple social life in which contacts are few, is concentrated in great industrial cities in which social life is most complex and contacts are many. The agencies of government and social control are centralized. The law rather than the individual who administers it is in the ascendancy. These conditions have filled the statute books with multitudinous laws, some simple and many very complicated. These the justice of the peace must interpret and administer. In a city of any consequence moreover the candidate for justice of the peace is little known by more than a few of the voters who elect him, and instead of electing an officer to try a case involving an occasional dispute between neighbors the electors are choosing a full time official of an inferior court.

The changes in the American social and political structure have thus made the office of justice of the peace rather anachronistic. In recent legislative enactments there is a tendency to improve the justice of the peace courts in some quarters and to abolish them in urban districts and great metropolitan centers. Where retained the justices are no longer maintained by fees paid by the litigants but receive a regular and substantial salary paid out of the public treasury. They are legally trained and in many instances are required to have devoted a definite number of years to the practise of the law before becoming candidates. Where these innovations are taking place, however, the new tribunals have

characteristics which really differentiate them from the old courts of the justices of the peace.

JUSTINIAN I (c. 482-565), Byzantine emperor. Justinian was born in Macedonia of an obscure family of Illyrian peasants. Under the protection of his uncle Justin he received his education at Constantinople, where he became saturated with the culture and traditions of Rome and of Christianity. In 518 Justin, who had risen to be commander in chief of the imperial guard, was able to assume the throne. As his counselor his nephew directed the policies of the government and in 527 became emperor in his own name. Justinian had one absorbing ambition from the moment of his enthronement—to restore the vanished Roman Empire to its ancient limits and glory by destroying the barbarian kingdoms which had been erected on its ruins. As soon as internal peace had been attained by the suppression of the Nika sedition in 532 he undertook the task of reconquering the west. In 533-34 his general Belisarius recaptured Africa from the Vandals; a prolonged war (536-52) resulted in the defeat of the Ostrogoths in Italy; in 554 part of Spain was wrested from the Visigoths. About the Mediterranean, once more a Roman lake, there thus emerged an empire of incomparable prestige, defended by immense fortifications on all its frontiers and headed by a skilful diplomat. Seeking to follow the tradition of the great Roman sovereigns in his internal policy also, Justinian ordained the restatement of the Roman law which is embodied in the *Corpus juris civilis* (q.v.), made extensive administrative reforms and enhanced the splendor of his office by the building of public works and the establishment of a luxurious court. His eternal glory is assured by two monuments, the Justinian Code and the basilica of St. Sophia.

Justinian's achievements were bought at heavy

cost. In his anxiety to undertake the western campaign he had made a hasty peace with Persia in 532, and between 540 and 555 Persia was able to win a disastrous victory over the empire in Asia; Huns and Slavs found opportunity to make inroads in the Balkan Peninsula. His gigantic foreign and domestic enterprises entailed expenditures necessitating oppressive taxation and leading finally to financial ruin. The legacy of the aged Justinian to his successors was a disrupted empire, an army near to annihilation and the difficulties of liquidation.

The end of the reign also demonstrated the transiency of his religious policy. Justinian had early realized that in order to secure his predominance in the west he must effect a reunion between the Eastern and Western churches, root out the Monophysite and Nestorian heresies and establish the orthodox religion of the papacy. Under the influence of his wife, Theodora, a friend of the Monophysites, he attempted to carry out this policy by finding a basis for compromise with that sect. All his theological ardor and all the authoritarian brutality of his "Caesaropapism" were employed to this end. But the death of Theodora in 548 deprived him of a collaborator of remarkable intelligence and political wisdom. In spite of the apparent success of the Fifth Oecumenical Council in 553 he failed completely to reestablish religious unity. The miserable close of his reign does not, however, affect his position in history as an eminent representative of two great ideas, imperialism and Christianity. Justinian the Great—posterity in Byzantium did not begrudge him the title—was indeed the last of the great Roman emperors.

JUSTO, JUAN BAUTISTA (1865-1928), Argentinian statesman and sociologist. Justo studied surgery in Argentina and Europe and was a practising physician, abandoning his profes-

sion upon entrance into the Argentinian National Congress. In 1895 he founded the Socialist party of Argentina, which sought to reform the venal and fraudulent local assemblies. With the introduction of secret voting in 1912 by the Law of Sáenz Peña he succeeded in being elected to the Chamber of Deputies as member for Buenos Aires; he remained there until 1924, when he was appointed to the Senate.

Justo in 1909 expounded his social doctrine systematically in *Teoría y práctica de la historia*. He looked upon life as an intelligent activity through which man understands and dominates the biological world and creates the technical world with which history begins. With the development of economic activity and of means of communication cooperation arises, at first constrained, then intelligent; and as a result authority and the state are created. When authority becomes vested in a class jealous of its own privileges, the struggle of classes, which is the dynamic force of history, appears. From the standpoint of a scientific statesman rather than of an academic sociologist he analyzed Argentinian life in numerous pamphlets, articles and speeches. With a passion for individual and collective discipline he formulated the program of the Socialist party in Argentina and Uruguay; he elaborated its doctrine, directed its parliamentary activity and from his vantage point as critic in the minority party did much to shape the ideas and methods of other parties. He translated the first volume of Marx' *Capital* and adapted Marxism to Argentinian economy, enlarging on the questions of land, money and taxation. He favored direct and progressive income and capital taxes, advocated free trade and sound money by free convertibility of paper money into specie and followed the principles of Henry George in denouncing the privilege of property in land, in advocating the confiscation of the unearned increment of rent and in demanding legislation regarding leases in order to bring about the economic stability of the farmer and to encourage agricultural progress.

Justo was eminently practical and was an agnostic in religious outlook. In addition to his political activity he founded a daily, *Vanguardia*, and was instrumental in organizing cooperatives, trade unions and universities and libraries for workmen; he imported from abroad new civilizing procedures and devices—from the use of asepsis in surgery to English political practises.

JUVENILE COURTS. *See* JUVENILE DELINQUENCY AND JUVENILE COURTS.

JUVENILE DELINQUENCY AND JUVENILE COURTS. In discussions of the problem child the term juvenile delinquency is sometimes loosely applied to youthful aberrance in general but it is more accurately a precise legal term defining the legal status of a child offender. Recognition of an offender as a juvenile delinquent places him in the jurisdiction of juvenile courts rather than the ordinary courts of criminal procedure; it gives him the status of ward of the state and subjects him to administrative authority or direct judicial control rather than to the processes of criminal law. He is placed under the legal disabilities and immunities of infancy. State supreme courts in the United States have held consistently that the private informal hearings of juvenile courts, their admission of social evidence, the absence of defense attorneys and the lack of trial by jury do not constitute a violation of due process of law because the child is not charged with crime. The procedure is primarily protective and educational rather than punitive, and the commission of a child to a correctional institution is deemed to be for his welfare and not for the sole purpose of inflicting penalty. Usually a specific act of misconduct must be alleged and proved in order to give the court jurisdiction over the child offender, but once he is before the court attention shifts from his act to his total situation in relation to the community. The informal procedure of the court and the regimen of correctional schools may mask real severities but on the whole there is a vast difference between a criminal procedure mitigated by occasional leniency on the part of a humanitarian judge and a legal system which accords separate consideration to offenders adjudged to be lacking in adult responsibility.

Theoretically it might be possible to trace the concept of juvenile delinquency in the grad-

ual evolution of law, which has long recognized limitations of legal capacity in childhood. Civil codes of all civilized societies have held that a child is unable to assume control of property or to contract personal obligations and have subjected him to a varying tutelage, endowing the father, mother, guardian or the court with authority to protect him from the consequences of folly and inexperience before he has reached the age of majority. It has been generally recognized that very young children are incapable of criminal intent, but the age of discretion has been placed very low—usually at seven years. Children over the minimum age limit were usually held fully responsible if they could be proved conscious of guilt. There has been no recognition of ameliorative factors, such as inadequate parental control or environmental conditioning. It is by no means demonstrated that the concept of juvenile delinquency was ever present. The line between child and adult was drawn with discrimination only where it was in the interests of profitable rights. To attribute to the early lawmakers the concept of child delinquency is pure guesswork, based on the desire to produce an ancient genealogy for a modern development.

The modifications in viewpoint and procedure which are entailed in the concept of juvenile delinquency arose from a changing public opinion, from new scientific knowledge and from the deliberate effort of social workers, humanitarians and educators. Their argument was that the common law concept *parens patriae* should be extended to criminal as well as civil law, that the immunities, privileges and disabilities which the state had already granted to children in the civil law dealing with property should be set up also as a barrier between the child offender and the rigors of adult criminal law. It was assumed that the child offender was handicapped by immaturity of body and mind and by a lack of effective parental control so that the exercise of discretion and the assumption of legal responsibility for conduct could not be exacted of him. The first comprehensive formulation in legal terms of the concept of juvenile delinquency, made by a committee of the Chicago Bar Association concerned with preparation of the first juvenile court law (1899), stated that "the fundamental idea of the law is that the State must step in and exercise guardianship over a child found under such adverse social or individual conditions as develop crime. . . . It proposes a plan whereby he may be

treated, not as a criminal or one legally charged with crime, but as a ward of the State, to receive practically the care, custody and discipline that are accorded the neglected and dependent child, and which, as the act states, 'shall approximate as nearly as may be that which should be given by its parents.' " It is evident that the intention of the sponsors of this law was to create an entirely fresh legal philosophy in the matter of crime committed by children.

The growing body of knowledge concerning the physical and mental processes of childhood furnishes the scientific basis for the concept of juvenile delinquency. Demonstration of significant differences between children and adults in memory, learning capacity, imagination, reasoning and volition have indicated that normal functioning depends upon maturation. Precise information as to the age of maturity in this scientific sense is lacking, but studies of the integrative action of the nervous system indicate that the adjustments necessary to full responsibility are impossible to the normal individual until after adult body size and weight are reached and the more subtle phases of neurological growth are completed. Whereas some individuals may attain "years of discretion" at eighteen or twenty-one, other normal individuals may require a longer period. Whatever further light research may throw on the biological nature of the causes of difference between the child's organism and the adult's, the fact of difference is now clearly established. The consequence of this observation is an increasing awareness of the child's inability to bear the full burden of adulthood.

Evidence from education and social work brings additional support to the concept of juvenile delinquency and indicates that the child's conduct is to a great degree a response to his environment. As knowledge has increased concerning the influence of emotion and personality upon behavior, techniques of child management in homes and schools have been gradually improved. Mental and physical health have become goals to be attained by following the laws of child development, and misconduct has become a problem to be solved by the use of knowledge rather than force.

The shift of emphasis from the symptoms to the causes of delinquency has led to intensive study of individual cases. Lying, stealing, truancy, stubbornness, running away, sex offenses and destructive acts are the chief objective manifestations of delinquency. In so far as

they are susceptible of a general statement it may be said that they are due to maladjustments of the child's personality; these maladjustments usually result either from an abnormal environment for the normal range of childish activities or from a warping of the child's personality through fear, antagonism and a sense of inadequacy.

The first step in understanding delinquency is the diagnosis of the child's personality. This is a cooperative task for physician, psychologist and social worker and involves prolonged observation. Evidence of physical and mental health, the objective features of environment, family background, economic and social situation, associations, recreation, school life and influence of religion become the foundation for an interpretation of the emotional and mental life of the child and for a program of treatment for the individual in the midst of his human relationships.

The clinical approach to the study of delinquency began in 1909 under William Healy in the laboratory established for the juvenile court in Chicago. Healy showed that a combination of factors is associated with delinquency and the particular combination varies with the individual case. Cyril Burt applied the analytic method to a study of English children in 1925 and reached a similar conclusion. The Rousseau Institute in Geneva and the German association for child welfare (*Zentrale für Jugendfürsorge*) have further emphasized the individual approach. Child guidance clinics have been organized in all large cities in the United States; the child guidance clinic serves as a diagnostic center and an agency of consultation for the juvenile court. It does not relieve the court of responsibility for treatment. Probation officers and social workers carry out the recommendations of the clinic and enlist the cooperation of families and schools. The educational result is therefore beyond that of the case treated; it includes the adults who assist in the administration. In 1931 a child guidance clinic was opened in London.

The habit clinic, which is usually connected with a hospital, school or state department of mental diseases, receives cases of incipient delinquency and young children subjected to handicap; it is another important resource in the treatment of delinquency. Adult education classes for parents form a further effective means of instruction in the problems of childhood. In Los Angeles, Detroit and New York City

foster mothers caring for children under the jurisdiction of the juvenile court have been instructed in classes of hygiene, nutrition, mental health and recreation. In some cities settlement houses conduct classes in child care and parents of delinquent children are urged to attend.

The two outstanding developments of the last decade in dealing with juvenile delinquency are the social control of the mental defective and the use of foster homes for the normal delinquent. The increasing use of standardized mental tests in the public schools has demonstrated that feeble-mindedness occurs among the non-delinquent population and bears no high causal relation to delinquency. Training programs for mental defectives include special education, within or without an institution, which may be followed by supervision in the community. Under such social control the feeble-minded are no more likely to commit offenses than the normal. Placement of normal delinquent children in foster homes rather than in institutions has developed chiefly in Massachusetts, California and Virginia. This method of dealing with delinquency is successful only where an extensive organization exists for child study and investigation of homes and where supervision by trained workers is adequate. No comparative study of costs exists but it is believed that foster home care is less expensive than is institutional care and its results of more permanent value.

A more recent suggestion is the control of delinquency by influencing the total social environment rather than proceeding by the case method. Studies of "delinquency areas" begun by Clifford R. Shaw in 1926 in Chicago and continued by Shaw and McKay in 1930-31 in Cleveland, Philadelphia, Seattle, Birmingham, Denver and Richmond indicate that high delinquency rates are always found in the belt of disorganized slum neighborhoods in the vicinity of business and industrial regions. These rates are relatively uninfluenced by nationality, degree of intelligence, family discord or psychological factors. The conclusion is that delinquency is correlated with the maladies of an industrial, competitive social order and can be best combated by changing the goals of civilization itself.

The Illinois law of 1899, already mentioned, introduced the juvenile court into the American system of jurisprudence. Since that time non-criminal tribunals for children have been established in all the states except Maine and Wy-

oming. In 1923 a committee appointed by the Children's Bureau to formulate juvenile court standards recommended that the age limit under which the juvenile court may obtain jurisdiction should be not lower than 18 years; at the present time over half the states have accepted this limit and in 5 states the limit is 21. In 28 states it is possible for a child charged with any offense, no matter what its degree, to be brought before the juvenile court. In some states the judge of the juvenile court may have jurisdiction at his discretion. In the District of Columbia, Georgia, Iowa, Louisiana, Massachusetts, New Jersey, New York, Utah and Vermont the law specifically excludes the juvenile court from jurisdiction in cases of felony or of crimes punishable by death or life sentence. In Ohio a recent enactment gives the juvenile court original jurisdiction in such cases.

In 1918 the Children's Bureau conducted a study of all courts, with a few minor exceptions, which have authority to hear children's cases involving delinquency or neglect (United States, Children's Bureau, *Publications*, no. 65, 1920). Of the 2391 courts addressed 1088 reported 79,946 cases of juvenile delinquency, 390 reported no delinquency cases and 556 did not report the number of cases handled. Nearly half of the courts had probation service. There were 321 courts in 43 states and the District of Columbia which were "specially organized" in the sense of offering a significant degree of specialization and organization for children's work. Of the total of 57 courts serving areas containing cities of 100,000 or more population 56 were specially organized and the other court failed to report. It is probable that most of the courts not answering the inquiry were unspecialized.

Accurate statistics as to the volume and extent of juvenile delinquency are difficult to obtain because of the lack of any precise and uniform definition of what constitutes delinquency, the variation in the age groups handled by the courts (15 to 21 being the range of the upper age limit), the numerous cases of felony by children which are brought before adult courts, the meager and inconsistent statistical records and the failure of the courts to cooperate. Statistics of cases coming before the juvenile courts have been collected by the Children's Bureau and figures are available for 1927, 1928 and 1929 (United States, Children's Bureau, *Publication*, no. 195, 1929, no. 200, 1930, and no. 207, 1931). A total of 46,312 cases

of delinquency were reported for 1929 by 93 juvenile courts representing 20 states and the District of Columbia. Because some of the children were dealt with more than once this figure represents only 41,101 children. There were 64 courts which reported cases dealt with unofficially, i.e. adjusted informally without being placed on the court calendar, and these numbered less than one third of the total number of cases reported by all the courts. In 16 percent of the official cases (89 courts reporting) and 2 percent of the unofficial cases the child was committed to an institution, and in 40 percent of the official cases and 11 percent of the unofficial cases the child was placed on probation. There were 61 courts reporting cases dismissed from probation or supervision and 14 percent of these dismissals were for purpose of commitment to an institution.

United States Census Bureau figures for juvenile delinquents in institutions are available for no year later than 1923 (United States, Bureau of the Census, *Children under Institutional Care*, 1923, 1927, p. 260-381). At that time figures were collected from 145 institutions in 46 states and the District of Columbia. On January 1, 1923, the number of children 10 to 17 years old, inclusive, in institutions primarily for juvenile delinquents was 23,003. On the basis of figures for the first six months of the year the number of children under 18 years of age admitted during the entire year was estimated at 18,640. These figures do not, however, include the entire juvenile population of correctional and penal institutions. In 1931 the juvenile delinquency section of the National Commission on Law Observance and Enforcement made a census of minors in the 98 adult penal institutions listed in the 1930 report of the Census Bureau. Data were compiled from 78 institutions, having an aggregate of 97,249 inmates, or 77 percent of the total prison population in the United States. Of these 54.8 percent were under 21 years of age when committed. The total number under 18 was 4493 boys and 228 girls, or 24.6 percent of those under 21.

Juvenile courts have been adopted also in England and throughout Europe, in Australia, New Zealand, Japan, Turkey and several other countries. European statistics are scrupulously compiled but in the absence of international definitions of delinquency and procedure comparison is almost impossible. It is believed, however, that the number of children appearing before juvenile courts is now decreasing through-

out the world, presumably because of extralegal methods of child care.

Juvenile courts in Europe were an outgrowth of American juvenile courts and for some time were guided by American precedents. Germany has had juvenile courts since 1908. The leading juvenile courts of France, Belgium, Holland and England were established by 1912. In 1930 the International Association of Children's Magistrates was organized in Brussels and 15 nations sent representatives to the convention. The purpose of the association is an interchange of the experience and ideas of those persons throughout the world who work with child offenders under judicial control, "so that young delinquent aliens may be treated according to a universal understanding."

European juvenile courts present both similarities and differences as compared with those in the United States. There are of course important variations throughout Europe. The courts of Austria, England, France, Germany and Czechoslovakia have incorporated educational ideals into existing criminal procedure, while Belgium, Holland, Spain and Portugal have created courts which depart more radically from penal methods. Throughout Europe, however, the juvenile courts are under central control and professional jurists exercise the dominant influence. In the United States there is no central control. The range of conflicting philosophies to which the child may be subjected is tremendous. For example, theft committed by a 14-year old boy may result in probation or a long term in an adult prison or commitment during minority to a juvenile training school or placement in a foster home; nor is the type of treatment always determined by differences in the child's case history. All degrees of intelligence and social experience are found in these various agencies. In the United States the local political situation and public opinion have more to do in determining juvenile court policy than a scientifically wrought plan.

According to European legal conceptions the judge must be the authoritative influence in juvenile court decisions. In Germany lay judges are nominated by the child welfare department (*Jugendamt*); they assist the judge in applying psychological and educational methods, but the treatment is primarily the responsibility of the presiding judge. This emphasis on legal authority, while found in some American juvenile courts, is entirely absent in others; in Cincinnati, for example, Judge Charles Hoffman

believing that the issues are sociological entrusts both decisions and treatment to child welfare experts, and his teaching and practise have been followed by many other American judges. In European courts there is a tendency to place the administration of juvenile probation in the hands of private organizations, doubtless because of the unprofessional nature of probation work in continental countries.

Following precedents of the Austrian law Germany has included those 18 to 21 years of age in juvenile procedure, and a strong movement has grown to withdraw those under 16 and to place them under a purely guardianship procedure. Belgium has established 16 as the age period below which children are legally *sans discernement*; Switzerland and Sweden have followed the same principle with certain modifications. Substitutes for juvenile courts are sought in a combination of what is called trustee education and boards of public welfare.

In the United States the police are dominant in the supervision of child offenders. In Europe special bureaus of police officers for children have developed but they are under judicial control whenever a child is removed from home. The American system gives to the police great discretionary powers over individuals, whereas in Europe their function is limited to preventive work under strict supervision of ministers of justice.

European juvenile courts in general, although they received their impetus from American ideals of state guardianship, have been more critically aware of the original objectives; they have developed uniform procedures closer to the civil side of the law than have American juvenile courts, which fluctuate between civil and criminal methods and are more dependent on the personality of judges, changes in public opinion and politics. The juvenile court in the United States is midway between two goals. It may develop into an agency of protection of the rights of childhood. In this case it will not administer treatment directly but will cooperate with schools, clinics and public welfare departments, all of them forming together a board of strategy to work for the best interests of the child. On the other hand, the juvenile court may become a criminal tribunal, hearing only serious cases which public and private social agencies have failed to prevent. In either case the outcome will be similar. By introducing the scientific study of cases, by individualization of treatment, by use of probation and by quickening the sense of

collective responsibility for the neglected and forsaken child the juvenile court method has permeated the criminal court and has put its yeast into the entire system of justice.

KABLUKOV, NIKOLAY ALEKSEYEVICH (1849-1919), Russian statistician and economist. Kablukov worked for over two years in the statistical bureau of the Moscow zemstvo and was later engaged in gathering statistical data on rural industries in the various provinces of northeastern Russia. From 1885 to 1907 he was the chief of statistics of the Moscow provincial

zemstvo and in this capacity supervised the rural household census of 1898-1900. His introduction to the tabular report of this census, reissued later as a separate volume (Moscow 1912), offers a valuable guide to the methods employed in zemstvo statistics. At the same time he was active in the statistical section of the Moscow Law Society, which functioned as the coordinating body for the work of zemstvo statisticians. In 1894 Kablukov began teaching at the University of Moscow; his courses included statistics (*Kurs statistiki*, Moscow 1911), agricultural economics and economic theory. He was the first chairman of the Chuprov society for social sciences, affiliated with the university and editor from 1914 to 1917 of the *Statisticheskyy vestnik*, a magazine published by the society.

As an economist Kablukov was interested principally in the question of the development of Russian agriculture along capitalistic lines. He did not share the belief current in the 1870's and 1880's that national peculiarities of the Russian people would guard it against the adoption of capitalism on the western model and pointed out that even the emancipation of the peasants in 1861 was dictated by the interests of developing capitalism. He maintained, however, that the specific forms of capitalist development vary in accordance with the characteristic peculiarities of the social economic systems in different countries. In studying agricultural estates in the province of Moscow he became aware of the difficulties encountered in the organization of large scale capitalist farms in Russia, and his work on capitalist agriculture in England (*Vopros o rabochikh v selskom khozyaystve*, Moscow 1884; tr. in part as *Die ländliche Arbeiterfrage*, 2nd ed. Stuttgart 1889) convinced him that farming based on hired labor is unprofitable and inefficient. In a later study, *Ob usloviyakh razvitiya krestyanskogo khozyaystva v Rossii* (Conditions of development of peasant farming in Russia, Moscow 1899, 2nd ed. 1908), which appeared at the time when the dispute between the populists and the Marxists was at its height, Kablukov supported the contention of the former group in pointing out that small peasant farming is capable of progressive development and that this is one of the essential prerequisites for the expansion of industry in Russia.

S. PROCOPOVICZ

KADLEC, KAREL (1865-1928), Czech historian of comparative Slavonic law. Kadlec occupied the chair of Slavonic law at the Charles

University at Prague from its establishment in 1899 until his death. He was general secretary of the Czech Academy of Arts and Sciences and editor of the periodical *Sborník věd právnických a státních* (Archives for legal and political science).

Kadlec was an outstanding authority on comparative Slavonic law. He broke with the romantic school and treated Slavonic legal history, which he regarded as a part of general comparative jurisprudence, in a positive and critical spirit. His special interest was the legal institutions of the Slavs before their dispersion and differentiation into various nations, for he held that the tribal characteristics of Slavonic law had not yet been scientifically established. In *Rodinný neděl čili združba v prvéu slovanském* (Prague 1898, 3rd ed. 1923) he discussed the Slavonic *zadruga*, an institution which he acknowledged to be peculiar to all agricultural peoples at a certain stage in their development and which he did not idealize in the fashion of other writers. Together with the history of Slavonic law he treated Hungarian and Rumanian law, which contain Slavonic elements, and he also investigated the law of the Wallachians as one of the foreign systems of law which operated among the Slavs. His articles in the fourth volume of the *Encyklopedja polska* summarized the history of Slavonic law up to the tenth century, which he reconstructed by the comparative regressive method. In his lectures read at the university he presented legal history from the tenth century on in separate courses on the public law of the different Slavonic peoples and in comparative treatments of the history of civil and criminal law and procedure. He was the author of *Dějiny veřejného práva ve střední Evropě* (Prague 1920, 4th ed. 1928), which studied comparatively Polish, Czech and Croatian public law as part of a system of central European law. Kadlec also devoted considerable attention to Yugoslav law, especially the Dalmatian statutes. At his death he left in manuscript a glossary of Slavonic law, the preparation and publication of which was taken over by the Czech Academy of Arts and Sciences.

THEODOR TARANOVSKY

Other important works: "Verböczyovo Tripartitum a soukromé právo uherské i chorvatské slechty v něm obsažené" (Verböczy's 'Tripartitum' and the private law of Hungarian and Croatian nobility therein included) in *Ceská Akademie*, Prague, *Rozpravy*, vol. x (1902) nos. 1, 3; *Valaši a valašské právo v zemích slovanských a uherských* (The Wallachians and Wallachian law in the Slavonic and Hungarian countries) (Prague 1916); "Les Slaves à la lumière de leur histoire politi-

que" in *Monde slave*, n.s., vol. ii (1925) pt. ii, 368-400, pt. iii, 29-61; "Statutem et reformationes insulae Brachiae" in *Monumenta historico-juridica slavorum meridionalium*, vol. xi (Zagreb 1926).

Consult: Taranovsky, T., *Uvod u ustorijsu slovenskih prava* (Introduction to the history of Slavonic law) (Belgrade 1922) p. 182-88; *Arhiv za pravne i društvene nauke*, vol. xxxv (1928) 1-14; Saturník, T., in *Slovanský Ústav, Ročenka*, vol. i (1928) 51-54; Schmid, H. F., in *Zeitschrift der Savigny-Stiftung für Rechtsgeschichte, Germanistische Abteilung*, vol. xlix (1929) 739-43; Odložilík, O., "Karel Kadlec" in *Slavonic Review*, vol. viii (1929-30) 204-05.

KAGWA, APOLO (1865-1927), Bantu statesman. Kagwa was converted to Christianity by Bishop Mackay of Uganda. He supported the British against the French and Mohammedan claimants of religious supremacy and trading rights in Uganda. In 1889 he became *katikiro*, or prime minister; three years later he took the leading part in drawing up the document whereby the Christian chiefs pledged themselves to emancipate their slaves. His influence largely convinced Mwanga, the *kabaka*, or king, and the people of Uganda to accept British protection. When in 1897 Mwanga revolted with the support of the Sudanese troops, Kagwa remained loyal to the British and led an army of Baganda against the rebels. He was the virtual ruler of Uganda during the long minority of the present *kabaka* and was the guiding spirit among the signatories of the Uganda Agreement of 1900, which defined the constitutional relationship between the British and the Baganda. Henceforth he was intimately associated with a succession of British administrators; he directed their educational program among his people, led the way in improving housing and sanitation and helped to further the cotton industry. Displaying keen interest in the legends and customs of the Baganda he rendered assistance to the anthropologist Roscoe and wrote two books in Luganda on the history of the Baganda kings and on Uganda folklore.

I. SCHAPERA

KAHL, WILHELM (1849-1932), German jurist. Kahl was born in Bavaria and studied at the University of Munich. He taught ecclesiastical, constitutional and criminal law at Rostock, Erlangen and Bonn and in 1895 succeeded Rudolf von Gneist at Berlin. His earliest important works are concerned with Protestant ecclesiastical law. With the exception of the important

expert opinion he rendered in 1896 in the controversy over the succession to the throne of Lippe, Kahl took little part in the development of constitutional law, which at that time was characterized by formalistic tendencies. After 1895 he devoted himself primarily to criminal law and was influential in bringing together the classical and modern schools of criminal law in the preparation of the new criminal code. Even better known than his achievements in the academic field are his practical and political contributions: he played an important part in the constitutional development of the Prussian evangelical church; he was instrumental in the reform of the criminal law and in the preparatory work for a new criminal code; he assisted in the drafting of the Weimar constitution and in subsequent legislative achievements under the republic.

Kahl's importance in the history of the social sciences in Germany is due to his peculiar combination of theory and practise. He was a follower of the German historical school of jurisprudence and of the German idealist philosophy; he did not specialize as do modern scholars and thus formed no school of his own. On the other hand, he typified the intellectual and spiritual universality characteristic of German historical and social thought in the middle of the nineteenth century. This quality was basic to his practical influence, to his unique eloquence, which was far more profound than mere oratorical technique, and to his frequently criticized capacity for compromise. He was the last representative of the so-called "political professors."

RUDOLF SMEND

Important works: *Lehrsystem des Kirchenrechts und der Kirchenpolitik* (Freiburg i. Br. 1894); "Religionsvergehen," and "Geminderte Zurechnungsfähigkeit" in *Vergleichende Darstellung des deutschen und ausländischen Strafrechts*, Besonderer Teil, vol. iii (Berlin 1906) p. 1-109, and Allgemeiner Teil, vol. i (1908) p. 1-78; *Gegenentwurf zum Vorentwurf eines deutschen Strafgesetzbuchs*, in collaboration with F. von Liszt and others (Berlin 1911).

Consult: Alsberg, M., *Wilhelm Kahl* (Berlin 1929) containing a bibliography of Kahl's chief works.

KÁLLAY, BENI (1839-1903), Austro-Hungarian statesman and historian. After a previous career in parliament, in the diplomatic service and in the Ministry of Foreign Affairs Kállay served from 1882 until his death as imperial minister of finance and in this capacity was administrator of Bosnia and Herzegovina. He was

especially qualified for these responsibilities by his travels in the Near East and his constant studies in the history and literature of the Balkan nations. His administration was conducted in an enlightened but cautious and conservative spirit, natural enough considering the unbalanced state of affairs of the Hapsburg monarchy at that time. Kállay was fully conscious of the inevitable disintegration of the Turkish Empire and of the growth of Serbia which would ensue. He was aware also of the danger for the monarchy and particularly for Hungary inherent in the situation; accordingly he and Count Andrassy tried to counterbalance it by the occupation of Bosnia (1878). Kállay's administration of Bosnia consisted in developing the economic and strategic resources of the country and in trying to create a special Bosnian nationality distinct from the Serbian and Croatian. He therefore favored the Moslem landowning nobility against the Greek Orthodox Serbian and Catholic Croatian peasantry.

Among his notable literary works are *Oroszország keleti törekvései* (Budapest 1878, 2nd ed. 1879; tr. into German by H. Schwicker as *Die Orientpolitik Russlands*, Budapest 1878), an analysis of the Russian policy in the Near East, and two works on Serbian history, *A szerbek története 1780-1815* (Budapest 1877; tr. into German by H. Schwicker as *Geschichte der Serben von den ältesten Zeiten bis 1815*, 2 vols., Budapest 1878-85) and *A szerb felkelés története 1807-1810* (2 vols., Budapest 1909; tr. into German by S. Beigel as *Geschichte des serbischen Aufstandes, 1807-1810*, Vienna 1910). Kállay was an indefatigable fact gatherer and his judgment of the sources is sagacious and unbiased. He belongs to that class of historians so rare on the continent who combine scholarly erudition with the experience of the practical statesman.

ROBERT BRAUN

Consult: Thallóczy, Lajos, *Benjamin Kállay, Gedenkrede* (Budapest 1909); Wertheimer, E. von, "Ein ungedrucktes Memorandum Benjamin von Kállays über die Annexion Bosniens" in *Ungarische Rundschau*, vol. iii (1914) 425-34, especially 425-26.

KAMÁL MAHMAD NÁMŪK (1840-88), Turkish publicist. Kamál was educated by private tutors except for a brief period of formal schooling in Constantinople. The descendant of eminent government officials who had suffered from the arbitrary rule of the sultans, he was impressed at an early age with the ideas of resistance to evil and revolt against despotism. As a

young man he came under the influence of Şinâsî, who was endeavoring to attract the Turkish intellectuals to western culture, and at about twenty he began his journalistic career as a contributor to Şinâsî's newspaper, *Tâşvîr-i Afkâr*, in which he attacked fearlessly the old regime. In 1864 he became its chief editor and allied himself with the Young Turk movement. From then on he lived the feverish life of a revolutionary agitator, frequently suffering prison and exile; the government occasionally effected his removal from the capital by appointing him to provincial offices.

Kamâl became the most prominent of the group of remarkable men who in a mediaeval environment laid the foundations of a new era. He aimed at a literary, political and social awakening in Turkey and through his essays in the periodical press, through his historical novels, plays, poems and histories, he tried to give the Turks a new interpretation of their past and a new idea of their destiny. In 1866 he fled to London, where he published the organ of the Young Turks, *Hürriyat* (Liberty), which was distributed secretly in Turkey. Upon his return in 1871 he published the daily *İbrat* (Instruction), the most influential periodical in modern Turkey, which not only strove to bring about a public spirited progressive government but also to develop new principles in morality, in family life and in the position of women and to create a new and simpler language. Kamâl's patriotic play, *Wâtan* (Fatherland, Constantinople 1872), was produced in 1873 and created a wave of frenzied enthusiasm. In the play, which stressed devotion to the fatherland rather than the older loyalties to the sultan and Islam, a Turkish girl dressed as a man became a soldier in a defensive war against Russia. *Wâtan* was suppressed after its second performance.

Kamâl never completed his history of the Ottoman Empire, which he considered his life work. *Madkhal*, the introduction, deals with Roman and Islamic history to 1046. The history proper goes only so far as the death of Sultan Selim I (1520). These works are, however, more significant for their style than for their historical value. Kamâl's other historical writings deal with biographies of prominent Turks and with remarkable episodes in Turkish history. He also translated into Turkish the works of Montesquieu, Rousseau and Bacon.

Despite the constant suppression of Kamâl's works they were circulated secretly in Turkey and had a revolutionary effect upon public

opinion. They were an important force in creating the concept of a Turkish nation and in introducing western ideas. Kamâl's outstanding part in the development of modern Turkish prose has earned him a unique position in literary history.

AHMET EMIN

KAMIENSKI, HENRYK MICHAŁ (1812-65), Polish nationalist and social philosopher. A nobleman and landowner, Kamiński played both a political and an intellectual role in the struggle for national independence. He took part in the armed insurrection of 1830-31 and in the years following was active as a member of a secret revolutionary society and as one of the leaders of the "enthusiasts," the group of writers and intellectuals who were fostering a national Polish consciousness. Because of his revolutionary activity he was banished to northern Russia for three years. After his return he freed the serfs on his estates and went to live in Switzerland.

Like Cieszkowski Kamiński sought to work out a system of national Polish philosophy. Except for stating the general philosophic principle of activism, that existence is justified by action rather than by thought, he was concerned not so much with metaphysical principles as with the development of a system of social economics applicable to a rejuvenated Polish nation. He elaborated his views in his chief work, *Filozofja ekonomji materialnej ludzkiego społeczeństwa* (The philosophy of material economy of human society, 2 vols., Poznań 1843-45): accepting as basic the law of progressive development of society he viewed the institution of private property as indispensable to progress and adopted the general principle of harmony of individual and social interests operating through the mechanism of exchange. He regarded labor as the source of wealth and judged the social adequacy of an economic system by the extent to which it provided the people with opportunity to work; he stressed particularly the right of the peasant to the soil. He condemned all forms of exploitation whether based on physical force or on intellectual superiority. In *O prawdach żywotnych narodu polskiego* (On the vital truths of the Polish nation, Brussels 1844), written under

the pseudonym Filaret Prawdoski, he argued convincingly that the success of a political uprising against Russia depended upon the emancipation of the peasants, who would thus be won for the cause of national freedom. In his *Rossja i Europa-Polska* (written under the pseudonym X. Y. Z., Paris 1857; tr. into French as *La Russie et l'avenir*, 1858), a profound analysis of Russian government and society, Kamiński advises Poland to strive toward an understanding with Russia without renouncing national independence. He was probably the first to point out that the Russian agrarian commune was not an original autonomous institution as represented by the Slavophiles but an organ created by Russian bureaucracy in the interests of the state and the nobility.

K'ANG YU-WEI (1858-1927), Chinese political theorist and reformer. After receiving a classical education K'ang Yu-wei traveled through China, visiting Hongkong and Shanghai, where he was impressed by the achievements of western civilization. In 1891 he opened a school in Canton to teach what he conceived to be the "new learning," an eclectic conglomeration of Confucianism, Buddhism, the rational philosophy of neo-Confucianism and the rudiments of western science. Later he established a similar school in Kweilin. Convinced that China's salvation lay in reform along western lines, he started during the Sino-Japanese War the first political reform movement by organizing in a memorial to the emperor over a thousand candidates who were in Peking for the imperial civil service examination. He continued to petition the throne for radical political reforms and in 1898 won the confidence of the emperor Kuang-hsü, who soon proclaimed far reaching reform measures drafted largely by K'ang and his associates. When the inevitable reaction set in, the emperor was deprived of political power and K'ang fled to Japan. Remaining loyal to the idea of a constitutional monarchy he founded among the oversea Chinese the Pao Huang Tang, a society for the protection of the emperor and for Chinese reform. It attained a considerable fol-

lowing but with the development of Sun Yat-sen's movement it gradually experienced a loss of prestige.

K'ang Yu-wei's political philosophy as expressed in his *Ta Tung Shu* (The book of the great communion) was a peculiar combination of Confucianism and Buddhism intermingled with socialistic theories. It was based upon a highly utopian paragraph in the seventh book of the *Li Ki*, where the ideal state was described as the great world unity in which there was no private property and everyone had suitable employment. K'ang acknowledged the Buddhist conception that life is endless suffering and laid down the principle that political thinking should aim at relieving man's suffering and enhancing his happiness. Human suffering comes from the division of mankind into contending groups, like the family, the religious sect, the state and the race. In K'ang's utopia all such groupings are to undergo gradual elimination, ending in the abolition of national boundaries and the development of a world state.

In his theory of the Confucian canon K'ang was a follower of Liu Feng-lu (1776-1829), who had tried to prove that the *Tso Chuan* was an independent history and not a commentary on the Confucian *Ch'un Ch'iu*. K'ang developed the latter's ideas and won them serious consideration. He tried to revive Confucianism by reinterpreting it to conform with modern conditions. To him Confucianism was international and progressive. Its true doctrines were, he claimed, to be found only in Confucius' own writings. In his *Hsin Hsüeh Wei Ching K'ao* (Forged classics of the new dynasty, Peking 1891) he condemned a number of the classics as forgeries of the Ancient Script school, attempting to prove with copious documentary evidence that these most readable and therefore most influential of the Confucian texts were forged by Liu Hsin (d. 22 A.D.) for the support of the dynasty founded by Wang Mang (9-23 A.D.). But when all these texts including the *Tso Chuan* and the *Chou Li* are excluded, very little is left of Confucianism; thus the great leader of the last revival of Confucianism unwittingly sounded its death knell as a state religion. His theories have, however, exercised great influence upon modern Chinese thought.

KANKRIN, COUNT EGOR FRANZEVICH (Georg Cancrin) (1774-1845), Russian statesman and economist. Kankrin, the son of a German engineer in Russian employ, went to Russia in 1797. He attracted attention with his *Fragmente über die Kriegskunst* (St. Petersburg 1809, 2nd ed. Brunswick 1815) and from 1811 to 1820 occupied important positions in the army supply service. In 1821 he was appointed to the State Council and from 1823 to 1844 served as minister of finance. By exercising the most rigid economy, avoiding an increase in the public debt and rationalizing the organization of the ministry and its accounting system he succeeded in balancing the normal budget and in raising the badly shaken credit of the government virtually to par. He imposed only one new tax, a moderate tobacco excise, and with a view to increasing revenue and combating official corruption restored the farming out of the government liquor monopoly. Public revenue was also increased by the protectionist tariffs which he substituted for the prohibitory tariff of 1822; he used them deliberately, changing the rates from time to time, to tax the privileged classes and to encourage the development of industry either by the promise of huge profits or by the threat of foreign competition. A similar interpenetration of fiscal and economic considerations characterized the currency reform of 1839-43. Since the assignats (paper money) were at a discount of 70 to 80 percent in terms of silver, he refused to follow the program of Speransky and the previous finance minister, Count Guryev, who resorted to foreign loans in an attempt to raise the value of the assignats to par. Kankrin proposed instead to stabilize paper money in relation to silver at the ratio of $3\frac{1}{2}$ to 1. The economic progress of Russia and the increased Russian output of gold favored the success of the plan and in 1839 the silver ruble was declared the standard coin. In 1840 the government issued in exchange for gold and silver deposit certificates backed in full

by a metallic reserve. The succeeding stages of the reform—the issue of credit notes with a metallic coverage of one sixth begun in 1841 and the exchange of assignats and deposit certificates for credit notes begun in 1843—were carried through at the initiative and insistence of Emperor Nicolas I despite the opposition of Kankrin, who feared the abuse of credit note issue by the government, an eventuality which came to pass during the Crimean War. Aided by currency stabilization, protection and measures taken to promote technical education Russian industry advanced rapidly during Kankrin's administration.

As a writer on economic subjects Kankrin showed more understanding of contemporary Russia than the German-Russian economists of the Smith-Say tradition. He was critical of the abstractness and rationalism of classical economics, anticipated List's critique of free trade and some of the ideas of the historico-ethical school and treated mercantilism in a manner resembling the later work of Schmoller.

KANT, IMMANUEL (1724-1804), German philosopher. A professor at the University of Königsberg during his entire academic life, Kant left an influence on modern philosophy which is unexampled in its scope. His philosophy, known as criticism or critical idealism, besides producing several schools of disciples formed the point of departure for the development of the various philosophies of absolute idealism. In regard to social science and social philosophy Kant's influence was felt both through the repercussions of his general philosophy and through the applications which he himself made in his works on philosophy of history, philosophy of law, anthropology and the like.

For a proper understanding of Kant's thought one must begin not, as is ordinarily thought, with the *Critique of Pure Reason* but with the *Critique of Practical Reason*. In the didactic and methodic order of Kant's writings the former precedes the latter, but in the real, systematic order Kant maintains always the primacy of the practical reason. At the center and focus of Kant's thought there is always to be found the concept of transcendentalism and the transcendental problem of freedom. But freedom here means for him not chance or arbitrariness, not an antithesis to law; it signifies rather the highest realization of the idea of law in the universe. Man is free as an ethical subject; for although as an ethical subject he is governed by a universal system of laws, the system is not one which is imposed on him from without through the impersonal compulsion of things or through the command of an external authority but rather one that he has given to himself. The concept of freedom thus coincides for Kant with the concept of self-legislation, or autonomy. He does not maintain that man is free from the domination of the law of causality: as an empirical being, as a phenomenon in space and time, he is on the contrary bound by it; and all his acts taken as purely empirical appearances fall under this law. But over against this order of mere nature stands another order, the order of ends; the noumenal world over against the phenomenal world, the *mundus intelligibilis* over against the *mundus sensibilis*. In this noumenal order man reveals himself as free because, while here too he is subjected to law, this relationship in no way implies a dependence upon a foreign will but rather brings his own will to realization. By his own will must be understood of course not desire and sensuous inclination but the pure will of reason, the norm of practical reason. "A rational being must always regard himself as giving laws either as member or as sovereign in a kingdom of ends which is rendered possible by the freedom of the will. . . . Morality consists then in the reference of all action to the legislation which alone can render a kingdom of ends possible. This legislation must be capable of existing in every rational being, and of emanating from his will, so that the principle of this will is, therefore, never to act on any maxim which could not without contradiction be also a universal law, and accordingly always so to act that the will could at the same time regard itself as giving in its maxims universal laws." This sums up what Kant means by the fundamental

ethical law, the categorical imperative. This law implies also that man as a subject of moral self-legislation can be subjected to no other norm than one that he can regard as rational and recognize as intrinsically necessary. Man can never be considered and treated as a mere means, as a cog in the social machine; on the contrary, he is and remains, ethically considered, an unconditioned end in himself. This self-legislation includes the state of being an end for oneself: autonomy includes autotelicity. The categorical imperative may therefore be expressed more precisely and completely in the form: "So act as to treat humanity, whether in thine own person or in that of any other, in every case as an end withal, never as a means only."

If the principle of transcendental freedom is also to be maintained and validated in the field of theoretical philosophy, then indeed nothing short of a complete intellectual revolution is necessary. The nature of the problems treated by previous metaphysics must be changed from the ground up. Metaphysics started out from the concept of being; it attributed to being a definite nature, i.e. definite predicates which belong to it necessarily and inherently, and it taught further that it was the function of knowledge to apprehend these predicates completely. The truth of knowledge thus consisted in the fact that in knowledge the essence of things was correctly and adequately copied. The revolution made by Kant, which he himself compared to the work of Copernicus, consists in the fact that he does not begin with any dogmatic description of being in order to determine on this basis the concept and nature of knowledge but rather starts with an inquiry into knowledge in order that in the end he may advance to being, to firmly grounded propositions about the reality of things. In this sense the key to the problem of knowledge lies for him in the fact that knowledge must not be regulated by things, but that things as empirical objects must be regulated by the fundamental condition of the faculty of knowledge. For as objects of experience (as phenomena) they can be given to us only in the form of experience and according to its fundamental and universal laws; these laws in turn depend, however, on the form of the understanding and on its a priori basic functions. Thus here too the spontaneity of the pure understanding, the free lawmaking power of the theoretical faculty, becomes a condition for every judgment concerning the being of objects, a condition for objective truth. Here too we can

"know of things a priori what we ourselves put into them"; we find an order in nature, in the appearances of space and time, because these appearances in order to be known by us must have assumed the form of knowledge, i.e. must be determined in accordance with the general and necessary rules of perception and pure thought.

The idea of freedom stands at the center of Kant's philosophy of history and his social philosophy, and it is this idea which determines their entire construction. "One can," he explains in his *Idee zu einer allgemeinen Geschichte in weltbürgerlicher Absicht* (1784), "regard the history of the human race in general as the fulfilment of nature's secret plan to prepare an internally and, for this purpose, also externally complete system of government, as the only condition in which it can fully develop all its designs on mankind." Thus the greatest problem for the human race and the greatest concrete task placed before it become the attainment of a universal law administering civil society; i.e. a society which is not founded on a mere relationship of might, a relationship of rulers and ruled, but which considers every one of its members as an end in himself, as a free agent who participates in the constitution and administration of the whole and who to that extent heeds the laws only because he has given them to himself. In the development of this thought Kant follows primarily the natural right doctrine of Rousseau, who is for him the "Newton of the moral world." He too bases the state and society on the idea of the social contract, but in the formulation of this contract he differs from Rousseau especially in that he lays a much greater stress upon the pure ideal significance of the idea of contract. The original contract is for him no empirico-historical fact, but it remains nevertheless or rather for this reason the guiding maxim behind all legislation and all civil and social administration. It is by no means necessary to assume it as an actual fact—indeed this is quite impossible; it is rather a mere idea of reason, which has, however, its unquestionable practical reality; namely, "to bind every law giver to make his laws in such a way as they could have sprung from the united will of an entire people, and to regard every subject, in so far as he wishes to be a citizen, on the basis of whether he has conformed to that will."

The historical significance of Kant's social and political philosophy lies not in the specific content of these propositions, which he took

from the natural right doctrines of the seventeenth and eighteenth centuries, but rather in the fact that he translated these propositions into the language and systematic relations of his critical philosophy. The effect of this translation was twofold. In the first place, it separated natural right or natural law as the basis of social and political thought from all confusion with natural law in the physical sense. What the political rationalists had called natural laws were for Kant the laws of freedom or moral laws; and these were applicable to the sense world as regulative maxims side by side with the theoretical laws of science, since both emanated, although in different ways, from the free law-making powers of the human spirit and neither represented the naked laws of being. In the second place, by setting up the content of natural right as the contribution of moral reason or the noumenal world acting in opposition to the sense world Kant, whether intentionally or not, introduced a principle of development into his political theory where the theorists of the Enlightenment had seen only the fixed and eternal principles of natural law, which were incidentally those of political individualism and parliamentary democracy. Because the principles of freedom were regulative maxims, Platonic ideals rather than fully realized facts, it soon became apparent that the immanent ideal force behind these principles was superior to any specific rational interpretation of them made at a given stage of human history. It was in this way, for example, that Fichte proceeding on a Kantian basis developed the principles of socialism by reinterpreting Kant's doctrine of the autonomy of the will and simultaneously overthrowing the individualistic version of the social contract idea.

Because of the immanence of such fertile seeds in his doctrine the influence of Kant's social philosophy has been no less profound than the theoretical developments which proceeded from his *Critique of Pure Reason*. The philosophy of German idealism, as it took form in the systems of Fichte, Schelling and Hegel, proceeded essentially from his doctrine. Hegel's doctrine that world history is a progress in the consciousness of freedom and that the essential task of all philosophy of history consists in recognizing the necessity of this progress is in a certain sense the complete expansion of the principle formulated and established by Kant in his *Ideen* of 1784. Hegel of course substituted for the Kantian opposition of the noumenal and phenomenal worlds, by means of which freedom is realized,

the objective dialectic of the historical process; and as a result he deviates fundamentally from Kant in the construction of his own philosophy of law and political theory. He rejects and even subjects to sharp criticism the notion of natural law from which Kant set out, and he not only makes law identical with the positive law of the state but makes the state the basis of ethics instead of ethics the basis of the state. Fichte, on the other hand, followed closely, as has been said, the original Kantian tendency; and he has the essential merit of having derived from it definite, concrete consequences, which have penetrated deeply into the modern doctrine of society and which moreover have had a lasting influence on the development of the socialistic theories of the nineteenth century.

Fichte was enabled to draw new consequences from the Kantian doctrine of ethics and politics principally by bringing together far more closely than Kant had done the moral world of ends and the phenomenal world of things. The moral personality of the individual, which belongs to the kingdom of ends and which is in no way to be determined by the world of things or the empirical influences exercised by the world of things, must for Fichte express itself in the phenomenal world by imposing its form, its action, upon it. This conception, when taken in connection with the Kantian categorical imperative bidding us to regard all personalities as free ends and never as means, meant that the problem of freedom and expression for one personality could not be solved without a simultaneous and organic solution of the problem of freedom and expression for all personalities. Otherwise the free expression of one personality would mean the exercise of empirical pressure and empirical determination on other personalities. Thus for Fichte individual ethics was dissolved into social ethics. Moreover another consequence of bringing closer together the moral and the sense worlds was to introduce a continuity between ethics and politics where Kant had left too large a gap. For Fichte the moral life in relation to the state was not confined to a legitimizing of political obedience as a moral necessity; it included the duty of rationalizing the state in accordance with moral principles—otherwise the moral life could not be properly carried on even in its own sphere. From this Fichte deduced the necessity for economic socialism (cf. *Der geschlossene Handelsstaat*, Tübingen, 1800) as an element of the political administration necessary for the liberation of the individual.

But while enlarging the activity and power of the state Fichte, unlike Hegel and the philosophies derived from Hegel, sought to make the state itself subordinate to the invisible moral society. In this way he remained faithful to the original Kantian conception of the moral autonomy of personality, while deducing from it both a non-individualistic ethics and a program of enlarged state functions.

In their joint relationship the basic ideas of Kant and Fichte have exercised an important influence on the formation of socialistic theories in the nineteenth century. While strict Marxism attached itself to Hegel, the influence of the Kantian tradition has been manifest in the case of non-Marxian socialist thinkers and sometimes even in the case of professed Marxists as well. Among the pioneers of German social democracy Lassalle should be mentioned as having derived some of his ideas from Fichte. Later within the movement of German neo-Kantianism the close connection between Kantian ethics and socialism was strongly emphasized by Hermann Cohen and Paul Natorp. They pointed out that socialism was a necessary consequence of the Kantian categorical imperative and that the socialist movement was essentially a moral movement whose philosophic basis is best expressed in the Kantian moral philosophy.

An increasing interest in Kant is also manifest among the political and intellectual leaders of the socialist movement. Among the French socialists Jaurès particularly referred to Kant in his thesis *De primis socialismi germanici lineamentis apud Lutherum, Kant, Fichte et Hegel*. In Germany the revisionist movement headed by Eduard Bernstein may be said to reflect the Kantian influence in its denial of the historical inevitability of socialism as preached by Marx and in its consequent stress upon the moral aspect of socialism. On the other hand, a quite different interest in Kant is represented in the writings of the Austrian socialist Max Adler. Disregarding the usual affinity drawn between the Kantian moral philosophy and the socialist movement Adler seeks to combine a more or less orthodox Marxism with Kant's theoretical philosophy, or critical methodology of science.

In contrast to the influence of Kant on the socialist movement mention should be made of the neo-Kantian school of jurisprudence represented by Stammler. Taking advantage of the Kantian critical metaphysics Stammler rehabilitates in his doctrine of the just law the essential contention of the old theory of natural right but

gives to natural right a variable content, corresponding to what is just under given historical conditions rather than to a fixed natural principle for all time. In this way he avoids what he regards as the formalism and circularity of the legal positivists, who confine themselves to what the law is and never discuss its relations to the human purposes which it seeks to express. While regarding the just law as the regulator of social and economic life Stammler contrasts law and economics as form and content, the line of demarcation between which he defines once and for all. Unlike many of the philosophical neo-Kantians he is opposed to socialism and to any alteration of the present constitutive distinction between the sphere of law and that of private economic activity regulated by law.

KARADŽIĆ, VUK STEFANOVIĆ (1787-1864), Serbian language reformer and national leader. Vuk, the son of a Herzegovinian peasant, is especially important for his work in the field of linguistics and literature. He raised the popular Serbian tongue to the level of a literary language. He introduced phonetic spelling, brought the popular vocabulary into lexicographical form and improved the Serbian grammar. He collected folk songs, tales and proverbs, translated the New Testament and by overcoming the enormous resistance of unenlightened tradition brought about the conditions prerequisite to the development of the newer Serbian literature. Skerlić has called him the "chief author of Serbian nationalism in the nineteenth century," for his work was instrumental in bringing the Serbians, hitherto under the Turkish yoke and scarcely known to Europe, into proud self-consciousness. It was as a result of his efforts that Serbian folk songs were brought to the enthusiastic attention of Goethe, Jacob Grimm and Alexander von Humboldt; and it was his active preparation and cooperation that enabled Ranke to write his important work on Serbian history. The spread of Serbian nationalism was accelerated not only by this new interest on the part of western thinkers but also by the very nature of the reform Vuk introduced, which had its roots in the language and customs of the mass of the people. The idiom of the peasants and herdsmen now took on all the dignity of a literary language, and the Serbian nation became aware of its past as reflected in song and tradition. In his researches Vuk embraced the whole of Serbian nationality, unlimited by administrative or religious boundaries, and thus brought to the Serbs a new realization of their intellectual and cultural unity. Maintaining that the essence and strength of the Serbian people were centered not in the "European" Serbs of Hungary but in those in the southwest—Serbia, Bosnia, Herzegovina and

Montenegro—Vuk was largely responsible for the emphasis on the Balkan character of Serbian nationalism.

Vuk indignantly opposed the attempt to force on the Serbians the labored designation Illyrians and put forward the untenable concept that in the then existing kingdom of Croatia there were no Croatians but in addition to Slovenians only Catholic Serbians. Actually, however, Vuk's reform of the Serbian language aided Gaj in his reform of the Croatian language; through the work of these two men the Greek orthodox and the Croatian parts of the Serbo-Croatian nation attained a common literary language, even though one used the Cirillic and the other the Latin alphabet. In 1850 Vuk organized in Vienna a formal literary convention, in which distinguished intellectual leaders of Croatia took part; adopting as its basic principle the view that "one people must have one literature" this convention proclaimed the phonetically written dialect of southern Herzegovina as the common literary language of the Serbians and Croatians, thus erecting a milestone on the road to Yugoslav unity.

HERMANN WENDEL

Consult: Skerlić, J., *Istorija nove srpske književnosti* (History of new Serbian literature) (3rd ed. Belgrade 1921) p. 155-94; Stojanović, L., *Život i rad Vuka Stefanovića Karadžića* (The life and work of V. S. Karadžić) (Belgrade 1924); Wendel, H., *Südslawische Silhouetten* (Frankfort 1924).

KARAGEORGE, PETROVIĆ (1768-1817), Serbian nationalist and statesman. One of the founders of modern Serbia, he was of peasant stock and fought in the Austrian army against Turkey. Among the chief organizers of the Serbian rising in the pashalic of Belgrade caused by the intolerable oppression of the Dahis, the chiefs of the Janizaries, in 1804 he was chosen commander in chief of the insurrectionary forces. The revolt began as a typical peasant insurrection. Even Karageorge believed that his principal task was to free the pashalic of the "bad" Turks rather than of Turkish dominion in general. Later, however, as the movement succeeded and as it became obvious that an agreement with the sultan could not be arrived at peaceably, Karageorge yielded to the influence of the Serbian intellectuals of Austria-Hungary and directed the movement toward complete independence, appealing to the Serbs of other Turkish provinces to join him. He won popular support in his own province and in 1811 was proclaimed hereditary ruler of Serbia by the

Skupshtina (national assembly). Although recognized by the European countries this move was effected only after a long and embittered struggle with other leaders and led to party differences which considerably weakened national resistance. During Karageorge's rule schools and courts were established and a national government was organized under a constitution which aimed at centralized control. The withdrawal of Russian support, due to the war between Napoleon and Russia, led, however, to renewed attacks by Turkey and to the signal defeat of the Serbs in 1813. Karageorge fled to Austria and then to Russia but returned in 1817 intending to foment a general revolt of all Christians in the Balkans, after a new rising under Milosh Obrenović had ended in 1815 in a compromise agreement with the Turks. Shortly after his return he was murdered, probably with the connivance of Obrenović. Nevertheless, the relative success of Karageorge's earlier insurrection gave a tremendous impetus to the movement for the liberation of the Serbs and of all the southern Slavs living under foreign dominion.

The idea of Yugoslav unity was furthered by Karageorge's descendants. His son, Prince Aleksander Karageorgević (1806-85), who reigned from 1842 to 1858, was primarily interested, however, in transforming Serbia from a Turkish province into a modern European state and therefore devoted himself to laying the foundations of government and to sponsoring an educational renaissance. The grandson of Karageorge was King Peter I (1844-1921). He encouraged parliamentary government and his reign from 1903 to 1921 marked an era of relative prosperity.

FERDO ŠIŠIĆ

Consult: Vukićević, M., *Karageorge*, 2 vols. (Belgrade 1907-12); Ćorović, V., *Karageorge* (Belgrade 1923); Novaković, S., *Vaskrs države srpske* (3rd ed. Belgrade 1914), tr. into German by G. Grassl as *Die Wiedergeburt des serbischen Staates (1804-1813)* (Sarajevo 1912); Temperley, H. W. V., *History of Serbia* (London 1917) p. 180-95, 226-38.

KARAMZIN, NIKOLAY MIKHAYLOVICH (1766-1826), Russian historian and man of letters. Karamzin, who matured in the second, reactionary half of Catherine II's reign, represents a generation averse to politics and inclined toward literature. Early in life he shed the liberalism borrowed from the Masonic friends of his youth, the Novikov group, and in the course of time became increasingly conservative; thus in 1811 he spoke for the nobility in opposing

Speransky's liberal reforms in a memorial on the old and new Russia (*Zapiska o drevney i novoy Rossii*) presented to Alexander I. Karamzin's significance in the history of Russian culture is manifold. As a writer he inaugurated the short period of sentimentalism which followed the pseudo-classicism of the eighteenth century. His tales, *Bednaya Liza* (tr. as *La pauvre Lise*, Paris 1808) and *Natalya, boyarskaya doch* (Nathalie, a boyar's daughter), the earliest and best novels of this school, won for him a large following among readers and writers. More important is his contribution to the reform of the literary language, in which he anticipated Pushkin. Striving after French elegance he substituted a graceful prose and a number of neologisms of his own for the heavy Germanic-Latin syntax of Lomonosov and old Slavonic idioms. His *Pisma russkago puteshestvennika* (tr. as *Travels from Moscow* . . . , 3 vols., London 1803), describing his journey through Germany, France, Switzerland and England in 1789-90, introduced Russian readers to the literary and philosophical novelties of contemporary Europe but failed to indicate any comprehension of the significance of the French Revolution.

Karamzin's chief and most lasting work is *Istoriya gosudarstva rossiyskago* (History of the Russian state), which presents a general survey of Russian history from the earliest times to 1611. It was begun in 1803, when he received from the government an annual stipend and the title of historiographer, and was left unfinished at Karamzin's death. The history, emphasizing the personalities of the rulers, acquired immediate popularity; it was written attractively, vividly portraying the heroes as models of virtue while painting the villains an uncompromising black. Its scientific value, however, is limited to the extensive notes which furnished excerpts from primary sources, of which some had hitherto been unknown and others have since been lost. Karamzin followed the established authorities for various periods, such as Schlözer and Shcherbatov, and remained faithful to the traditional interpretation of Tatishchev which regarded autocracy as the sole state building factor in Russian history. For this reason Karamzin's history served under Nicholas I as the banner for the forces of the official "Russian orientation."

PAUL MILIUKOV

Works: A collection, which does not include the history, correspondence and a number of other writings, was first published in 8 volumes (Moscow 1803-04); the best later edition is in 9 volumes (4th ed. St. Petersburg

1834-35). The first edition of the history appeared in 8 volumes (St. Petersburg 1818); the first complete edition is in 12 volumes (St. Petersburg 1818-29); the best later edition is the 5th with a valuable guide by P. M. Stroeve (St. Petersburg 1842-43). There exists a German translation of the history (11 vols., Riga 1820-33), and one in French by St. Thomas and Jauffret (11 vols., Paris 1819-26).

Consult: Pogodin, M. P., *N. M. Karamzin*, 2 vols. (Moscow 1866); Miliukov, P. N., *Glavniya techeniya russkoy istoricheskoy misli* (Main currents of Russian historiography) (2nd ed. Moscow 1898) p. 147-258; Mirsky, D. S., *A History of Russian Literature* (London 1927) p. 79-84.

KARAVELOFF, LUBEN (1837?-79), Bulgarian revolutionist, author and folklorist. Karaveloff, whose parents were engaged in commerce in the Balkan mountains, traveled in his youth through Bulgaria, Serbia and Bosnia, thus attaining a wide knowledge of the life of the Bulgarian people, which was to serve him in his works on folklore. In 1857 he went to Russia, where he remained until 1866; this sojourn was of decisive significance for his later political and literary activity and for the genesis and formation of his ideas. In Moscow he associated with the radicals prominent in the 1860's and was considerably influenced by the socio-political critique of Herzen, Bakunin, Chernyshevsky, Dobrolubov and Pisarev, which aroused him to constructive activity for the political and social liberation of his fatherland and his people. This activity was first concentrated in journalism: Karaveloff contributed informational, propagandist reports and articles on Bulgaria to Russian journals; published ethnographical, folklore material, such as his *Pamyatniki narodnago bita Bolgar* (Memorials of Bulgarian folk customs, Moscow 1861); and wrote tales of Bulgarian life. After his return to the Balkans in 1867 he soon attained a leading position in the emigrant movement in Belgrade and Bucharest. In Belgrade he became the authoritative teacher of the Bulgarian legionaries, whom he provided with completely new aims and duties, conceiving of the revolutionary organization of the masses as the only real means of carrying on the struggle against Turkey. He was active also as a publicist among the Serbs and soon attained a leading role in the Serbian radical youth movement which cooperated with the Bulgarian legionaries.

Karaveloff's chief activity was carried on between 1869 and 1874. After the rupture between the "old" emigrants, who sought liberation through Russian intervention and demanded for the Bulgaria of the future a plutocratic constitu-

tion with a bicameral system, and the younger radical democratic and social revolutionary progressives Karaveloff became in 1871 chairman of the newly formed Central Revolutionary Committee. Supported by V. Levski he organized a network of revolutionary organization cells throughout Bulgaria, which were to serve as the skeleton of the revolutionary army. The newspapers edited by him, *Svoboda* (Liberty) and *Nezavisimost* (Independence), also served the same end, the revolutionary awakening of the people to active warfare against foreign domination. After his retirement from political life in 1875 Karaveloff devoted himself to literary and cultural pursuits.

Karaveloff held that the liberty and independence of Bulgaria were to be attained only through revolutionary civil warfare and self-liberation. He attacked not only the Ottoman system of political and economic domination over the Balkan peoples but also its parasites, the opportunist Bulgarian patricians. Stressing the idea of a Balkan federation he advocated the principle of the solidarity of the Bulgarian interests with those of the other Balkan peoples, the Serbs and the Greeks. In his *Weltanschauung* he was a rationalist and positivist: "knowledge is power." He was thus in favor of practical positive knowledge to be dedicated to the attainment of improvements in material conditions of living, in the natural and economic sciences, in social progress and in the democratic organization of social life.

JOSEF MATL

Works: *Sochineniya*, 8 vols. (Ruschuk 1886–88).

Consult: Semenoff, N. P., *Lubin Karaveloff, sa vie et ses oeuvres* (Fribourg 1897); Klincharov, I. G., *Lubin Karavelov* (in Bulgarian) (Sofia 1925); Angelov, B., *Bŭlgarska literatura*, 2 vols. (Sofia 1923–24) vol. ii, p. 191–213.

KAREYEV, NIKOLAY IVANOVICH (1850–1931), Russian historian and sociologist. Kareyev graduated from the University of Moscow in 1873, taught at Warsaw University from 1879 to 1884 and at the University of St. Petersburg from 1885 to 1899, when he was dismissed for advanced political views. He was able to continue teaching at the Alexander Lyceum and at the Polytechnic Institute (from 1902 to 1907) since neither of these institutions was controlled by the Ministry of Public Instruction. In the years preceding the 1905 revolution he was active in politics as member of the Constitutional Democratic (Cadet) party, to whose program of au-

tonomy for national minorities he was particularly attached, and in 1906 he was elected to the Second Duma. In 1907 he resumed teaching at the University of St. Petersburg, where he remained until he was retired on a pension by the Soviet government.

Kareyev belongs to the generation of Russian intelligentsia which was influenced by the revolutionary struggle of the populists (*narodniki*) against the government of Alexander II, and his prolific writings reflect their preoccupation with the agrarian problem and their social idealism. Kareyev's earliest studies dealt with the position of the French peasantry on the eve of the revolution, a controversial question which his researches in French archives helped to clarify. In the last twenty years of his life he returned to the subject of the French Revolution, publishing monographs on the Paris sections, on the revolutionary committees and on the historiography of the revolution. His doctoral dissertation on the basic questions of philosophy of history, which elicited a lively controversy upon its publication in 1883, was the first of his many works on philosophy of history and on sociology. Opposed to historical materialism, he emphasized the importance of individuality and individual volition in the historical process and advocated a subjective-teleological interpretation of history; thus he shared the views of the Russian subjective sociology school of Lavrov and Mikhaylovsky and had points of contact with Simmel and Dilthey.

Kareyev's writings on French and Polish history and his collaboration on French scientific publications brought him renown abroad, particularly in France. In Russia he was most widely known for his six-volume text of modern European history, of which he prepared many abridgments for secondary school and college use, and for his five "typological" courses, in which he surveyed important historical periods emphasizing the typical political institutions. Before the World War he was very popular with the Russian youth, with whom he kept in close touch as professor, as leader of many private study circles, as chairman of the St. Petersburg organization for promoting self-education—the Russian prototype of the English university extension—and as author of general essays intended as aids in forming a *Weltanschauung* and in advancing intellectual and moral development.

PAUL MILIUKOV

St. Petersburg 1897); *Sushchnost istoricheskogo protsesa i rol lichnosti v istorii* (The meaning of history and the role of personality in the historical process) (St. Petersburg 1890, 2nd ed. 1914); *Starie i novie etudi ob ekonomicheskom materializme* (Old and new essays on economic materialism) (St. Petersburg 1896); *Vvedenie v izuchenie sotsiologii* (Introduction to the study of sociology) (St. Petersburg 1897, 2nd ed. 1907); *Pisma k uchashcheymsya molodezhi o samoobrazovanii* (Letters to young students on self-education) (St. Petersburg 1894, 9th ed. 1907).

KARISHEV, NIKOLAY ALEXANDROVICH (1855-1905), Russian economist. In the years 1885 to 1899 Karishev, a graduate of the University of Moscow, taught economics and statistics at various institutions of higher learning in Moscow, St. Petersburg and Dorpat. During some of this time he lived on his estate in the province of Ekaterinoslav, where he was active in zemstvo work, particularly in developing and improving rural education. From 1889 to 1891 he also directed the economic division of the Moscow zemstvo, where he initiated systematic assistance to peasant agriculture.

Karishev was a prolific writer on economic and social subjects, particularly those related to agriculture and agrarian organization. He contributed numerous articles to newspapers and magazines and from 1893 to 1898 published monthly economic-statistical surveys in the populist magazine *Russkoe bogatstvo* (Russian fortune). In *Trud, ego rol i usloviya ego prilozheniya v proizvodstve* (Labor, its role and the conditions of its application to production, St. Petersburg 1897) he provided the first instalment of a system of inductive-descriptive economics, which he strongly championed in opposition to abstract theory. His most important work, *Krestyanskiya vnenadelniya arendi* (Peasant tenancies, Moscow 1892), is a thorough analysis based on a large collection of zemstvo statistics. The renting by peasants of lands owned by the nobility was an important feature of peasant economy in post-reform Russia; it resulted from the inadequacy of allotments granted the peasants at the time of their emancipation and reflected a hunger for land which was becoming more acute with

the natural increase of the peasantry. Karishev described the amount and geographic distribution of peasant tenancies, the variation in the form and terms of the leases and the influence of the system on peasant agriculture, the intensification of which it retarded. He found that the demand for rentable land exceeded its supply; that land was rented mostly under one-year leases and often through intermediaries; that leases calling for rent in kind (share of the crop or labor) were increasing; and that rent per unit was inversely correlated with the size of the peasant's own holdings. In a posthumous collection of articles, *Iz literaturi voprosa o krupnom i melkom selskom khozyaystve* (Problem of large and small scale agriculture; ed. by A. Fortunatov, Moscow 1905), he advocated the development of cooperative agriculture on the basis of the Russian land commune (*obshchina*) in preference to capitalistic large scale farming on the one hand and small scale peasant proprietorship on the other.

Consult: Kaufman, A., in Russia, Ministerstvo Narodnago Prosveshcheniya, *Zhurnal* (1905) no. 5, p. 1-16.

KARL FRIEDRICH, MARGRAVE AND GRAND DUKE OF BADEN (1728-1811). Karl Friedrich was distinguished for his attempt to introduce physiocratic principles into the administration of three villages in his province. Practically he was concerned with lightening the burden of feudal regulations and with restricting the excessive subdivision of peasant property. As opposed to large feudal estates and farm tenancy he encouraged the ownership of land by the peasant cultivator. At the same time he claimed as a sovereign the right of coproprietorship and the reversion of a share of the net product in the form of a land tax. His views as well as his reforms, which were unsuccessful, were tinged with a certain cameralistic-fiscal patriarchy characteristic of German physiocracy and particularly of Schlettwein, his learned adviser and assistant. The margrave received advice also from French sources; his correspondence with Mirabeau and DuPont de Nemours (ed. by Karl Knies, 2 vols., Heidelberg 1892) forms an important contribution to the physiocratic literature. The *Abrégé des principes de l'économie politique* (printed originally in *Éphémérides du citoyen*, vol. i; published separately, Karlsruhe 1772; reprinted in E. Daire's *Physiocrates*, Paris 1846, pt. i, p. 367-85), in which the margrave summarized his views, is nearest to pure physio-

cratic doctrine and reflects at the same time the rationalist conceptions of the age of Enlightenment.

KÁRMÁN, MÓR (1843-1915), Hungarian educator. Kármán played a decisive part in the modernization of the educational system of Hungary. While he owed much to the ideas of Herbart he possessed considerable originality. After two years in Leipsic, where he worked with Ziller, Kármán returned to Hungary and in 1872 joined the faculty of the University of Budapest as *Privatdozent* in pedagogy, psychology and ethics; later he became professor. He influenced the entire Hungarian educational system as teacher, writer and public official and trained a new generation of teachers. The earliest result of Kármán's activity was the reform of the elementary school curriculum. His most important sphere of activity, however, was the high school. Here he gave expression to the strong national spirit in education which developed when Hungary regained its autonomy. The entrance of the middle classes into the high schools and the addition of the natural sciences to the curricula led Kármán to the promotion of three types of high schools emphasizing respectively the historical sciences, the natural sciences and preparation for scholarship. At the same time Kármán considered also the possibility of a unified school in which national literature, history and geography as well as various elective languages would be taught all pupils. In methodology he was an adherent of Ziller's theory of cultural stages and formed the curricula accordingly. Kármán assigned the methodological and pedagogical training of high school teachers to the philosophical faculty, to which high schools were attached as practise schools. The curriculum and disciplinary system which he worked out for the secondary schools dominated Hungarian education until 1927.

KARO, JOSEPH BEN EPHRAIM (1488-1575), Jewish codifier and commentator. Karo was born in the Iberian Peninsula and as a child witnessed the expulsion of the Jews from Spain in 1492 and from Portugal in 1496. He was brought by his family to Turkey and after 1535 lived at Safed in Palestine, the intellectual center of the refugee Spanish Jews. Together with his teacher Jacob Berab he attempted in 1538 to renew the old Talmudic ordination, which would have led eventually to the convocation of a great Sanhedrin empowered to issue new laws for the Jewish people, but the movement failed because of the opposition of the Jerusalem rabbis.

Two extensive commentaries on the great mediaeval codes of Jacob ben Asher and Maimonides constitute Karo's chief work. In his *Beth Yosef* (4 vols., Venice and Sabionetta 1550-59) supplemented by the *Bedek ha-bayith* (Salonika 1605) Karo subjected Jacob ben Asher's code to close scrutiny and supported it by extensive quotations from the original sources of Jewish law down to his own contemporaries, frequently, however, reaching an independent conclusion. In his *Kesef mishnah* (4 vols., Venice 1574-75; tr. into French by J. de Pavly and M. A. Neviasky as *Rituel de judaïsme*, 12 vols., Orléans 1898-1917) he rendered the same service to Maimonides, defending him especially against the attacks of ibn Daud.

But it is to a brief synopsis written primarily for pedagogic purposes rather than to these extensive works that Karo owes his great prominence in the history of Jewish codification. In his *Shulchan aruch* (Venice 1565) he adopted Maimonides' method in stating the law briefly without quotations from previous authorities. Unlike Maimonides, however, Karo eliminated all Talmudic laws which were no longer applicable in his own time. In this respect as well as in the whole arrangement of the four parts he followed the lead of Jacob ben Asher. The book at first provoked vigorous opposition, particu-

larly on the part of the German-Polish rabbis, who saw in its decisions a one-sided glorification of the Spanish-Jewish ritual and customs. It also found a strong competitor in a similar compilation by Mordecai Jafe. Nevertheless, it soon became and still remains the authoritative code of laws for orthodox Jewry. This achievement was partly due to the work of an opponent, Moses Isserles, who through his criticisms helped to spread rather than to destroy its authority. The Polish rabbis of the seventeenth century further enhanced its authority through their own extensive commentaries. On the other hand, the book has always been severely denounced by anti-semitic writers who, lifting certain statements out of their context, managed to give them an unfavorable connotation. Liberal Jews in modern times have likewise frequently attacked it as the embodiment of Jewish "legalism."

SALO BARON

Consult: Cassel, D., "Josef Karo und das Maggid Mescharim" in *Lehranstalt für die Wissenschaft des Judenthums*, Berlin, *Bericht*, no. 6 (Berlin 1888) p. 3-10; Friedberg, B., *Rabbenu Yosef Karo*, in Hebrew (Drohobycz 1895); Tschernowitz, C., *Die Entstehung des Schulchan-Aruch* (Berne 1915).

KASIM AMIN (c. 1865-1908), Egyptian social reformer. Kasim Bey Amin studied law in France and he was thereafter employed in the government service for twenty-three years, first with the Mixed Tribunal and finally as judge of the Native Court of Appeal.

He was one of the pioneer champions of women's rights in the Islamic world and the author of *Tahrir al-mar'ah* (Cairo 1899; tr. into German by O. Rescher as *Über die Frauenemanzipation*, Stuttgart 1928) and *Al-Mar'at al-jadidah* (A discussion on the rights of women, Cairo 1901; Russian translation by I. U. Krachkovsky, St. Petersburg 1912). The subject status of women is a tenet of the Islamic faith and these literary labors for the emancipation of eastern womanhood would have had little effect against fanatical conservatism but for Kasim Amin's presentation of the reform. He not only protested against regarding emancipation as antireligious but presented it rather as a religious reformation and a revival of the equal and equitable status assigned to women by primitive Islamic society. His argument that the harem and purdah are not in their origin Islamic but Iranian and are due to the corruption of Turkish and Arabic tribal liberty and sexual equality by Byzantine and Persian despotisms and disenfranchisements was sufficiently convincing to

obscure the more fundamental religious fact of the attitude of Mohammed toward woman as expressed in the Koran.

His second and more sound approach was that emancipation is not only in the interests of the sex but in the interest of society. It is indeed disputable whether women gain by sacrificing the sufficient if subordinate economic provision for all sorts and conditions of womankind secured them in the Islamic community in return for the more prominent but far more precarious prospects of economic competition with men. Kasim Amin, however, in insisting that by subjecting women Islamic society lost its vitality gave the feminist cause a more convincing case than it had hitherto had. He urged such specific reforms as improved education for girls, a gradual transition from their existing status to one of economic independence, the abolition of polygamy and changes in the divorce law. Kasim Amin's work aroused considerable interest in most of the Islamic countries; but the effect of such academic attacks as his can easily be overestimated, and Egypt, the field of his labors, is now one of the less fertile in feminist progress.

GEORGE YOUNG

Consult: Rescher, O., Introduction to his German ed. of *Tahrir al-mar'ah* (Stuttgart 1928).

KASKEL, WALTER (1882-1928), German jurist. Early in his career Kaskel entered the national insurance office, where he aided in the solution of the many legal problems arising from the recently codified social insurance law. Later he became municipal counselor for the city of Schöneberg (now part of Berlin). In 1913 he began to teach at the University of Berlin, where he became professor in 1920; he taught with equal success also at the Berlin Handelshochschule, the Hochschule für Politik and the Verwaltungsakademie for the education of public officials.

Kaskel may be regarded as the founder of the science of modern German labor law. *Das neue Arbeitsrecht* (Berlin 1920, 2nd ed. 1920) and the textbook *Arbeitsrecht* (Berlin 1925; 4th ed. by H. Dersch, 1932) furnished the first legal elaboration of this new field of law, which has come to be of basic significance for the whole of German legal development. In his legal-dogmatic and systematic works Kaskel expounded with unparalleled clarity all the new legal concepts which underlie the modern tendency toward socialization of the law. His system of German labor law is now generally accepted. In addition

Kaskel's numerous essays and longer works have on many occasions provided the definitive expositions of various special problems of labor law.

Kaskel's writings on labor law were preceded by studies in social insurance law; the *Grundriss des sozialen Versicherungsrechts* (in collaboration with F. Sitzler, Berlin 1912) achieved an importance in this field almost equal to that later attained by his labor law writings. Kaskel was also the founder and codirector of two periodicals which have become of fundamental importance, the *Neue Zeitschrift für Arbeitsrecht* (1921) and the *Monatsschrift für Arbeiter- und Angestellten-Versicherung* (1913).

German legal science of the 1920's possessed scarcely any systematizer who could be compared with Kaskel. In his philosophy of law he was a positivist, but the charge of specialization and one-sidedness which is frequently made against him is unfounded, for he always recognized the interdependence of all fields of law. He realized especially the necessity of combining theory with practise, and on this account he exercised during the third decade of the present century an influence on the evolution of legislation and the administration of justice which scarcely any other university professor could match.

HANS PETERS

Consult: Juristische Wochenschrift, vol. lvii, pt. iii (1928) 2889-90; Peters, H., in *Monatsschrift für Arbeiter- und Angestellten-Versicherung*, vol. xvi (1928) 578-83.

KATKOV, MIKHAIL NIKIFOROVICH (1818-87), Russian journalist. Katkov was a professor of philosophy at the University of Moscow from 1845 to 1850 and in 1851 leased from the university its daily newspaper, *Moskovskiya vedomosti* (Moscow Gazette). He began to take his journalism seriously in 1856, when he established a monthly, *Russky vestnik* (Russian messenger). In 1863 he returned to the Moscow Gazette, with which he was associated in the last twenty-four years of his life as owner and editor. In this capacity he made a reputation as an independent journalist who was allowed unusual latitude in his criticism of the government and whose opinion carried weight in high circles. In fact, however, he had no genuine insight into political problems and was merely trimming his sails to impending changes in government policy. His apparent independence was the result of protection accorded to him by Alexander II and

Alexander III, who regarded Katkov as a conservative guide of public opinion.

Although in his youth he belonged to an advanced group of intellectuals led by Belinsky, as editor of the Moscow Gazette Katkov attacked most persistently and venomously the radical intelligentsia and the national minorities. He violently denounced the Polish insurrectionists of 1863 and thereafter detected "Polish intrigue" or radical inspiration in whatever incurred his displeasure. The virulence and occasional brilliance of his editorials scarcely compensated, however, for the instability of his opinions. Although for a number of years he advocated close collaboration with Germany he died a Franco-phile. Originally a rabid free trader, he later became an extreme protectionist. During the period of liberal reforms under Alexander II, Katkov professed admiration for the aristocratic institutions of old England and for this reason favored the establishment of local self-government (*zemstvo*) and trial by jury; but he attacked them most bitterly and called for an increase in gentry representation on *zemstvo* organs when after 1870 and especially after the accession of Alexander III government policy turned reactionary. In this period he advocated also Count Dmitry Tolstoy's educational reform, which for ulterior purposes stressed the study of Greek, Latin and mathematics in secondary schools.

PAUL MILIUKOV

Important works: 1863 god. Sobranie statey po polskomu voprosu (1863. Collection of articles on the Polish question), 2 vols. (Moscow 1887); *Sobranie peredovikh statey Moskovskikh vedomostey, 1863-1887 godov* (Collection of editorials of the Moscow Gazette, 1863-87), 25 vols. (Moscow 1897-98).

Consult: Sementkovsky, R., M. N. Katkov (St. Petersburg 1891); Liwoff, G., *Michel Katkoff et son époque* (Paris 1897).

KAUFMAN, ALEXANDR ARKADIEVICH (1864-1921), Russian statistician and student of agrarian problems. Kaufman, a converted Jew, was graduated from the University of St. Petersburg in 1885 and from 1887 to 1905 was in the service of the Ministry of Agriculture. Until 1893 he took a prominent part in a study of Siberian peasantry organized by the ministry, devoting particular attention to the immigrants from European Russia who settled in the provinces of Tobolsk and Tomsk. In the course of this study, whose methods followed those previously developed by *zemstvo* statisticians, Kaufman clearly grasped the characteristic features in the development of peasant land tenure

in Siberia. He found that despite the absence of serfdom and the relative freedom from administrative pressure the original individual holding of land by right of occupation had been changing, with the growing shortage of land, in the direction of increasingly communal and equalitarian forms of tenure; the unhampered evolution of landholding in Siberia appeared thus to reproduce the development of the land commune in Russia proper. This evolutionary scheme, constituting an important original contribution, Kaufman presented in a manner characteristic of his methods first in an article (in *Vestnik Evrope*, 1893, no. 6), then in a small book (*Krestyanskaya obshchina v Sibiri*, The peasant commune in Siberia, St. Petersburg 1898) and, finally, in a large tome (*Russkaya obshchina v protsesse eya razvozhdeniya i rosta*, The Russian commune in the process of its birth and growth, Moscow 1908). After 1893 he concentrated upon problems of governmental land policy in connection with new settlements in Siberia and in other Russian colonization areas and prepared a number of official reports and memoranda. He generalized some of his conclusions in *Pereselenie i kolonizatsiya* (Migration and colonization, Moscow 1905), in which he held that migration to new areas merely mitigates the acuteness of the land problem; as a radical solution he advised the intensification of agriculture, which he believed to be compatible with the maintenance of communal tenure. In 1905 and 1906 he assisted in drafting a project for the compulsory alienation of land from the nobility and its distribution among the peasants; upon the failure of this plan he was active as an agrarian expert in the councils of the Constitutional Democratic (Kadet) party. After 1908 he taught statistics in St. Petersburg. Although then past middle age and enfeebled by a chronic disease he succeeded in becoming a recognized master in a field relatively new to him—theory and methods of statistics. His treatise on statistics (Moscow 1912, 4th ed. 1922; German version as *Theorie und Methoden der Statistik*, Tübingen 1913), still the best general text in Russian, synthesizes the empirical advances of zemstvo statistics and the logical mathematical contributions of European theorists. His history of Russian statistics published posthumously (*Statisticheskaya nauka v Rossii*, Moscow 1922) furnishes the only available survey of developments in theory and methodology from 1806 to 1917.

K. KOCHAROVSKY

KAUTILYA, Hindu political theorist. Kautilya is identified according to ancient Indian tradition, which has been questioned by many scholars, with Chanakya, the Brahman minister of the Maurya emperor Chandragupta, who reigned from about 321 to 296 B.C. A number of European scholars ascribe the writings of Kautilya to the Gupta period (c. 320–480 A.D.). He is the reputed author of a work, long lost but recovered in 1909, entitled *Arthashastra*, which deals with the art of government, including civil law and the science of warfare. *Arthashastra* signifies the art of government, and quotations and references in the work of Kautilya and others point to a long antecedent line of individual authors and schools dealing with this subject. Kautilya's task was to summarize and put in order the chaotic ideas of these authors. His work, however, is much more than a mere synthesis; it is rather a reconstruction of the science of government. Whereas some of the older teachers in accordance with the avowed aim of *Arthashastra* to promote the security and prosperity of the state refused to include the holy *Vedas* among the four traditional sciences, Kautilya gives the *Vedas* along with philosophy, economics and politics their due place in the social economy. Nevertheless, he considers politics the determinant of all the rest, because punishment comes within its sphere. His theory of kingship, which in the interests of monarchical power derives the authority of the king from his divine nature and from a kind of social contract, was by no means fundamental and was subsequently superseded by the theory of the king's divinity by virtue of his office.

But Kautilya's theories of the state were merely incidental. He was primarily interested in the concrete problems of government, and the essence of his thought like that of his predecessors relates to statecraft in the two broad divisions of the acquisition and preservation of dominion. His guiding principle is the interest of the monarch. Education and self-discipline of the king, he urged, are the first requisites of successful government. This precept is fortified by a number of examples from traditional history, a fact which illustrates the author's application of the historical method. Expediency forms the keynote of Kautilya's rules concerning foreign relations, and in his nice balancing of policy with the circumstances of states he makes a fine art of politics. In sacrificing morality and religion to the interests of the state Kautilya, who has been called the Indian Machiavelli,

followed the example of earlier authors. He advocated the free resort to assassination for the suppression of ill disposed and wicked subjects. His rules for replenishing the treasury in emergencies include various ingenious methods for the political exploitation of popular superstitions. In general, however, he reserved his immoral statecraft for extreme cases, while elsewhere, as in his rules for the acquisition of dominion, he favored kind treatment of subjects as an important means of insuring royal rule.

Kautilya's influence upon later Hindu political theory was far reaching. He founded a tradition of statecraft which became a synonym for unscrupulous cunning and which although condemned by some was adopted by many later thinkers. His treatment of the older categories and concepts of *Arthashastra* gave them the stamp of finality in later Indian literature. Finally, his virtual reconstruction of *Arthashastra* probably helped the wholesale incorporation of its material into the law books (*Dharma Shastre*) and the *Mahabharata* (great epic).

U. N. GHOSHAL

Works: The *Arthashastra* was first published by R. Shamasastri (Mysore 1909, rev. ed. 1924); improved editions are by T. Ganapati Sastri in Trivandrum Sanskrit series, nos. 79, 80, 82 (Trivandrum 1924-25), and by Julius Jolly and Richard Schmidt in the Punjab Sanskrit series, no. 4, vols. i-ii (Lahore 1923-24). An English translation was prepared by R. Shamasastri with an introduction by J. F. Fleet (3rd ed. Mysore 1929).

Consult: Banerjee, N. C., *Kautilya*, vol. i- (Calcutta 1927-); Stein, Otto, *Magasthenes und Kautilya*, Akademie der Wissenschaften, Philosophisch-historische Klasse, Sitzungsberichte, vol. cxc, pt. v (Vienna 1921); Ghoshal, U. N., *A History of Hindu Political Theories* (2nd ed. London 1927) ch. iii; Nâg, Kâlidâs, *Les théories diplomatiques de l'Inde ancienne et l'Arthashastra* (Paris 1923) chs. iii-v, tr. by V. R. Ramchandra Dikshitar in *Journal of Indian History*, vol. v (1926) 36-50, 235-66, 331-58, and vol. vi (1927-28) 15-35; Kane, P. V., *History of Dharmasastra*, vol. i- (Poona 1930-) p. 85-104; Winternitz, M., *Geschichte der indischen Literatur*, 3 vols. (Leipzig 1905-20) vol. iii, p. 509-29.

KAUTZ, GYULA (1829-1909), Hungarian economist. Kautz studied in Pest, Berlin, Heidelberg and Leipsic and taught first in Pozsony and later in Nagy-Várad and at the superior technical school in Pest. From 1863 to 1868 he was professor of public and administrative law and from 1868 to 1892 of economics and finance at the University of Budapest; after 1865 he was a member of parliament and from 1892 to 1900 governor of the Austro-Hungarian Bank. In

economics he was influenced primarily by Roscher, but he also devoted much attention to the doctrines of Hildebrand, L. von Stein and F. B. W. von Hermann. His interest centered mainly in the history of economic doctrines, in which he was undoubtedly the leading figure of his epoch. This fact was recognized not only by Karl Knies but also to a greater or less extent by Alfred Marshall, Ingram, Schumpeter and most of the new historians of economic theory. His works are characteristically comprehensive in scope; they display broad knowledge of the literature, great accuracy and amazing industry. Kautz endeavors always to explain economic phenomena and economic doctrines in relation to the general political and social development of their periods. Because of the wide range of his researches in the history of economic thought he was in many respects a pathfinder. He contributed much to the correct understanding of Cantillon and was also the first to point out the significance of the doctrines of Gossen. Essentially a follower of the older historical school, Kautz retained its eclectic tendency: with a basic emphasis on the spatial and temporal diversity of economic phenomena and special preference for socio-ethical considerations he still attempted to introduce in his discussions fragments of classical doctrine. He was stronger in comprehensive, synthetic research than in analysis and creativeness. In the main his method was narrative rather than critical; his style somewhat turgid and fatiguing. In the field of applied economics he was particularly interested in problems of currency and credit; in his practical work he emphasized the interests of an independent but liberal Hungary. Kautz was the author of the first Hungarian textbook in economics.

THEO SURÁNYI-UNGER

Important works: *Theorie und Geschichte der National-Ökonomik*, 2 vols. (Vienna 1858-60); *Politika vagy országásgáttan* (Politics or political science) (Pest 1862; 3rd ed. 1878); *A nemzetgazdaság- és pénzügytan* (Economics and finance), 3 vols. (Pest 1863; vol. i 5th ed., vols. ii-iii 4th ed. Budapest 1880-90); *Nemzetgazdaságunk és a vámpolitika* (Our national economy and the customs policy) (Pest 1866); *A nemzetgazdasági eszmék fejlődési története és befolyása a közviszonyokra Magyarországon* (Pest 1868, new ed. 1911), abridged translation by Sigmund Schiller as *Entwicklungs-Geschichte der volkswirtschaftlichen Ideen in Ungarn und deren Einfluss auf das Gemeinwesen* (Budapest 1876); *A társulási intézmények a nemzetgazdaságban* (Social institutions in the national economy) (Pest 1871, new ed. 1887).

KAVELIN, KONSTANTIN DMITRIEVICH (1818-85), Russian political philosopher and publicist. Kavelin received a doctorate at Moscow in 1844 for his dissertation on Russian law courts in the seventeenth and eighteenth centuries. He taught legal history at the University of Moscow from 1844 to 1848 and civil law at the University of St. Petersburg from 1857 to 1861 and at the Military Law Academy from 1878 until his death. In the years intervening between these professorships he was in the government service. His work as a scholar was not of lasting value. In accordance with his general view that social development involves the transition from a clan society with the individual personality completely submerged to a political society providing for the complete emancipation of the individual personality he supported Ewers' theory of clan organization as characteristic of the early period of Russian history. Kavelin's work on psychology and ethics, with which he was occupied after the political tide had turned reactionary in the late 1860's, was intended merely to provide a broad philosophical basis for the idealism of Russian youth and a refutation of positivism and materialism.

Kavelin is most important as a political philosopher and publicist. In the decade following his graduation he was affiliated with the westernists as the friend of Belinsky, Granovsky and Herzen but later showed himself a true conservative, a *narodnik* (populist) with a monarchist bias. He advocated the emancipation of peasants with land in order to create a conservative property owning class of farmers; for a similar reason he championed a moderate form of village community. At the same time he was skeptical of constitutional reform because it would transfer the dominant role in the state to the nobility and bourgeoisie and so disturb the political balance. Although in 1877 and again in 1881 he pleaded for the emancipation of the judiciary from political control, for greater autonomy in local government and for the introduction of members elected by the *zemstvo* organs into the State Council (the "Loris-Melikov constitution") he remained a consistent exponent of the idea of "social monarchy" or "autocratic republic," i.e. "a free czar independent of both the nobility and the plutocracy."

SOLOMON KUZNETS

Works: A nearly complete collection of Kavelin's works has been edited by D. A. Korsakov, 4 vols. (St. Petersburg 1897-1900), with biographical notices and appreciations by D. A. Korsakov, V. D. Spasovich

and A. F. Koni. His essay on communal tenure is translated by I. Tarassoff as *Der bäuerliche Gemeindebesitz in Russland* (Leipsic 1877) and his correspondence with Herzen by B. Minzes as *Sozial-politischer Briefwechsel* (Stuttgart 1894).

KAY-SHUTTLEWORTH, SIR JAMES (1804-77), English educational reformer. Kay was born in Rochdale and graduated in medicine from Edinburgh. In 1842 he married Janet Shuttleworth and assumed her name. He was a Benthamite in method, a Protestant by conviction, an Englishman in his instinct for administrative compromise, an anti-Owenite in his dislike of the French revolutionary ideal of centralized educational control by the secular state. A physician in Manchester from 1828 to 1835 and a distinguished physiological and pathological researcher, he became well known by his work among the poor during the 1832 cholera epidemic and by his writings on unsanitary living conditions among factory operatives. His careful studies inspired the establishment of the Manchester Statistical Society, which investigated the state of education in northern towns. He was for a while secretary of the Manchester Board of Health. An advocate of free trade and social reform, he saw education as the key to reform and urged the establishment of schools for poor children, libraries, mechanics' institutes, provident associations and adult classes in science, economics and domestic economy. He was appointed assistant poor law commissioner and was stationed in East Anglia from 1835 to 1838, when he was sent to London. In 1839 he was appointed first secretary to the Committee of Council on Education. Between 1834 and 1846 he designed a system of adjusting denominational schools to the central authority by means of inspection and grants-in-aid, a device which was copied for India by the East India Company in 1854 and confirmed by the British government in 1864. Partly guided by foreign experience, he introduced pedagogical training and the pupil-teacher system and tried numerous educational experiments. He devised a concordat between government and the churches on educational affairs which, although attacked by many Churchmen and Nonconformists, proved a stable foundation for the modern English elementary school system established in the acts of 1870 and 1902. After resigning in 1849 he continued to be active in public work; his chief energies went to the establishment of evening classes in east Lancashire factory towns, the development of a public relief system during

the cotton famine of 1862 and the advancement of higher education.

MICHAEL E. SADLER

Important works: *The School in Its Relations to the State, the Church and the Congregation* (London 1847); *Four Periods of Public Education, 1832-39-46-62* (London 1862); *Reports on the Training of Pauper Children* (London 1839); *The Moral and Physical Condition of the Working Classes Employed in the Cotton Manufacture in Manchester* (London 1832, 2nd ed. 1832).

Consult: Smith, Frank, *Life and Work of Sir James Kay-Shuttleworth* (London 1923), and *A History of English Elementary Education* (London 1931).

KEARNEY, DENIS (1847-1907), American politician. Kearney was born in Ireland and came to California in 1868. As a drayman in San Francisco he was for "law and order" and affected contempt for the laboring man. After the great railway strike of 1877 he became America's most proficient leader of unemployed workers, exploiting the popular slogan "The Chinese must go!" to keep San Francisco in an uproar and in constant expectation of mob violence. His vituperative speeches were directed also against selfish corporations and corporate control of government. As a result of repeated arrests he acquired the crown of a labor martyr. His success in bringing to a head the issue of Chinese exclusion he owed to the support not only of the white California worker but largely to the small employer and merchant who also felt the pinch of Chinese competition. His Working Men's party shaped and carried to adoption a state constitution favorable to his views and was a major factor in city and state politics from 1877 to 1880, but his attempt to become more than a local figure had failed utterly when he retired in 1884.

The Kearney movement, innocent of any broad social philosophy, is significant chiefly as a dramatic forerunner of the job and wage conscious trade unionism developed by Gompers and Strasser a few years later. Incidentally it contributed to creating a race issue which still makes for disunion among California workers, although the Chinese question has become much less important. Kearney's advocacy of independent labor politics had little influence.

KEITH, MINOR COOPER (1848-1929), American capitalist. Keith was the most important personal force in the economic penetration of Central America by the United States. In 1871 his brother, Henry M. Keith, secured a contract from the Costa Rican government to construct a railroad from Puerto Limón to San José. When the government funds for the completion of the project were soon exhausted, Minor Keith undertook his first piece of foreign public financing, not only raising the capital for the railroad but floating a loan to consolidate the Costa Rican external debt. To supply traffic for the railroad he introduced banana plantations along its route and popularized the consumption of bananas in the United States, where they had until then been a rare luxury; he thus initiated an industry which spread all through Central America. In 1899 Keith organized the United Fruit Company, a combination of his own interests with the interests of the Boston Fruit Company and other companies in Cuba, Jamaica and Santo Domingo. The combination, which owned plantations, railroads and ships, integrated and augmented the formerly small and scattered American interests in the Caribbean. Serious charges of monopoly were made against Keith in connection with the organization and operation of the banana industry, the largest single activity of the United Fruit Company. The company with its increasingly varied interests was the spearhead of economic and political penetration of Central America by United States capital. In 1912 Keith organized the International Railways of Central America, which combined his railroad interests in Guatemala and Salvador. His project for a through Pan-American railway route to the isthmus, linking all the Central American lines with Mexico and the United States, was not quite realized before his death. Keith's imperialist methods led to his personal flotation of a loan to the Republic of Salvador in 1922, when he signed a contract with the government by which he and the International Railways of Central America secured \$19,750,000 for the republic on condition that 70 per cent of the customs of Salvador should be administered by an American collector general nominated by the bankers with the concurrence of the United States secretary of state, any disputes arising under the loan contract to be referred to the chief justice of the Supreme Court of the United States. For his almost single handed enterprise in exploiting and developing Central America Keith has been called the American Cecil

Rhodes. The empire he created expanded. In 1931 the United Fruit Company with fixed assets of \$170,000,000 cultivated over 470,000 acres in Central America, Colombia, Jamaica and Cuba and owned about 2,830,000 unimproved acres; it owned or operated 1773 miles of railroads, 568 miles of tramways and a fleet of 105 ships.

MARGARET ALEXANDER MARSH

KELETI, KÁROLY (1833-92), Hungarian statistician. Keleti was the first director of the department of statistics which was organized in the Hungarian Ministry of Finance in 1867. In 1871, when largely because of his efforts the ministerial department was expanded into an independent central bureau of statistics, he was appointed its first director and remained its leading spirit for over twenty years. For a time he was editor of Eötvös' *Politikai hetilap* and of the agricultural and statistical publication of the Hungarian Academy of Science, of which he became a member in 1868.

Keleti is recognized as the founder of Hungarian official statistics. The general lines of statistical organization as laid down by him are still followed today. He introduced the use of individual census cards in the census of 1880. The compilation and textual explanations of that census as well as of the subsequent censuses of births, marriages and deaths were likewise prepared by him. He provided an exemplary organization for the collection of trade statistics. His compilation of Hungarian alimentary statistics is not only an interesting document on the standard of living in Hungary but is valuable also from the biological and medical viewpoint. Keleti played an active part in international statistical congresses, for which he prepared numerous papers and reports.

THEODORE SZÉL

Important works: *A politikai gazdaság kézikönyve* (Handbook of political economy) (Pest 1863); *A magyar mező gazdaság* (Hungarian agriculture) (Pest 1867); *Telekadó és kataszter* (Land tax and the cadaster) (Pest 1868); *Hazánk és népe* (Our country and people) (Pest 1871; new ed., 2 vols., Budapest 1889); *Magyarország szőlészeti statisztikája, 1860-1873* (Budapest 1875), tr. into French by F. Schwiedland as *Viticulture de la Hongrie* (Budapest 1875); *Nemzetiségi*

KELLER, FRIEDRICH LUDWIG (1799-1861), Swiss jurist. Keller was born in Zurich. He was professor of Roman law at the universities of Zurich, Halle and Berlin. A disciple of Savigny and a firm adherent of the historical school, he prepared himself by travel and study in France and England for a political career. In Zurich in addition to his scientific work he was active as leader of the Liberal party, which assumed the political power in 1831 and completely reformed the constitution of the republic. Keller insisted on the separation of powers and a complete reorganization of the administration of justice. In Zurich he also published his first scientific works, which established his scholarly reputation in the field of Roman law. His political career having ended in failure, he left Switzerland in 1844 and devoted himself exclusively to science, after 1847 as successor of Savigny and Puchta at the University of Berlin. He died in Berlin.

Keller's scientific works, which are few but significant, deal especially with civil procedure. His essentially practical point of view found compatibility in the Roman jurists. His wide experience as a magistrate and his highly developed political sense gave his historical works a rare degree of clarity. "It was as though he himself had seen and heard the old praetors," writes one of his disciples. Keller took special interest in the English judicial system and is to be considered as one of the first to spread knowledge of English legal institutions in Germany.

HANS FRITZSCHE

Important works: *Über Litiscontestation und Urtheil nach classischem römischem Recht* (Zurich 1827); *Semestrium ad M. Tullium Ciceronem libri sex*, 3 pts. (Zurich 1842-51); *Der römische Civilprocess und die Actionen* (Leipsic 1852; 6th ed. by A. Wach, 1883); *Pandekten*, ed. by E. A. Friedberg (Leipsic 1861; 2nd ed. by W. Lewis, 2 vols., 1867).

Consult: Schneider, A., "Rede zur Feier des hundertsten Geburtstages des Prof. Dr. Fr. L. von Keller" in *Zeitschrift für schweizerisches Recht*, n.s., vol. xix (1900) 300-20; Schwarz, A. B., "Pandektenwissenschaft und heutiges romanistisches Studium" in Uni-

versity of Zurich, Rechts- und staatswissenschaftliche Fakultät, *Schweizerischer Juristentag 1928 . . . Festgabe* (Zurich 1928) p. 211-52; Fritzsche, H., *Begründung und Ausbau der neuzeitlichen Rechtspflege des Kantons Zürich* (Zurich 1931).

KELLEY, FLORENCE (1859-1932), American social worker and social reformer. She was interested in most of the social reform movements in the late nineteenth and early twentieth centuries but was most closely associated with the campaigns for protective laws for women workers, for effective child labor laws and for the establishment of the federal Children's Bureau. For the greater part of her working life she served as executive secretary of the National Consumers' League, an organization designed to use the power of consumers to remedy industrial ills, and she was largely responsible for the development of the league as an agent of propaganda and for its program of social welfare legislation.

Her education and previous experience made her unusually qualified for this work. Her interest in social problems, which was derived largely from her father, William D. Kelley, an eminent protectionist, had led her to enter Cornell University as one of its first women students; to continue her studies in Zurich, where she became interested in the doctrines of Marx; and at a later date, 1894, to take a degree in law at Northwestern University. From 1891 to 1899 she lived at Hull House in Chicago, learning at first hand about living and working conditions among the poor and seeking measures for their improvement. She was especially active in the campaign for the Sweatshop Act of 1893 and on the passage of the act was appointed by Governor Altgeld the first chief factory inspector in Illinois. Her vigorous enforcement of the law and her reports of the conditions she found in her inspections are unusual in the history of factory inspection in this country.

Florence Kelley was outstanding among the reformers of the period. She fought the battles of the workers, especially the women and child workers, with aggressiveness and determination both in arousing public opinion and in pressing legislation on the lawmaking bodies. She was much influenced by Marx and did not hesitate to show her feeling that employers were enemies who could be constrained to a minimum of decency only by legislation, nor did she fear to state openly that the goal for which she worked could never be achieved while production was carried on for private profit. She reflected the

spirit of her time in her desire for immediate remedial measures but not in her desire for the eventual overthrow of a capitalistic order; she was in accord with her time in her faith in legislation as an instrument of control but she was in advance of her contemporaries in her belief in national legislation and in her interest in skilful, intelligent administration in order to make laws effective.

HELEN R. WRIGHT

Important works: Translation of Engels' *Die Lage der arbeitenden Klasse in England in 1844* (New York 1886; new ed. London 1892, with special preface by Engels); *Some Ethical Gains through Legislation* (New York 1905); *Modern Industry* (New York 1914).

Consult: Adams, Mildred, "A Pioneer in Social Justice" in *Woman Citizen*, n.s., vol. ix, no. 12 (1924) 9, 29-30; Goldmark, Josephine, "Twenty Five Years of It" in *New Republic*, vol. xl (1924) 271-72; Lathrop, Julia C., "Florence Kelley 1859-1932" in *Survey*, vol. lxvii (1931-32) 677.

KELLEY, OLIVER HUDSON (1826-1913), American rural organizer. Kelley was born in Boston and was for a while a newspaper reporter and telegraph operator. He farmed in Minnesota from 1849 to 1864, when he became a clerk in the United States Department of Agriculture. In 1866, following an investigation of southern agricultural conditions, he conceived the idea of organizing farmers for education and social intercourse. He planned a secret fraternal society for men and women and in 1867 with six other government clerks organized the National Grange of the Patrons of Husbandry, of which he was national secretary until 1878. For five years Kelley devoted himself to the difficult work of organization, and he established the Grange soundly. Ceremonials and secrecy, deriving from Kelley's knowledge of Masonry, appear to have been effective in maintaining interest. In 1878 he ceased to be active in Grange affairs.

OLON J. BUCK

Consult: Kelley, Oliver H., *Origin and Progress of the Order of the Patrons of Husbandry in the United States* (Philadelphia 1875); Atkeson, Thomas C., *Semi-centennial History of the Patrons of Husbandry* (New York 1916) p. 315-17.

KELLEY, WILLIAM DARRAH (1814-90), American politician. Kelley, a native of Philadelphia, studied law and entered politics as a Democrat, serving as county attorney and as judge of the Common Pleas Court in Philadelphia. In the late 1850's falling under the influ-

ence of his townsman Henry C. Carey he became convinced that the depression following the panic of 1857 was due to free trade policies. He joined the newly formed Republican party and became one of the most ardent defenders of the protective system. His membership in the House of Representatives from 1861 to 1890 and in particular his association during much of this time with the Ways and Means Committee, of which he was chairman in the Forty-seventh Congress, enabled him to exert a decisive influence in committing the United States to a permanent policy of protective tariffs. His constant solicitude over the iron and steel schedule gained him the sobriquet of "Pig-iron" Kelley, a designation at which he took no umbrage.

Kelley's views were embodied in a volume, *Speeches, Addresses and Letters on Industrial and Financial Questions* (Philadelphia 1872), in which he held that in order to stimulate the active circulation of goods within a country it was necessary to protect capital and labor from foreign competition. By shutting out foreign products the nation also encouraged a needed inflow of immigrants and capital. Price, he maintained, was a relative term; goods were cheap not according to their money price but according to the ease with which they were disposed of in payment for purchases. Hence protection made for true cheapness of commodities by increasing the purchasing power of labor. Kelley addressed himself chiefly to the American working man and farmer. From the protective system, he insisted, every blessing was to flow. Thus in reply to an inquiry from a trade union group in 1869 concerning his stand on the eight-hour day he wrote: "Under its [protection's] influence labor is in demand, and the laborer is steadily becoming more independent; and if we perfect and maintain a system of thorough protection, you will be able to establish and maintain the eight-hour system."

After the Civil War Kelley opposed in a number of pamphlets the legislation aimed at currency deflation. He also voted against the Resumption Act of 1875 and for the Bland-Allison silver purchase bill of 1878, even joining with the majority to override President Hayes' veto of the latter measure. But in the Greenback and free silver agitations of the 1880's he played no part, leaving to Bland and other western representatives the task of championing the cause of cheap money.

A. D. H. KAPLAN

Consult: United States, Congress, *Memorial Addresses*

on the Life and Character of William D. Kelley Delivered in the House of Representatives and in the Senate, 51st Cong., 1st sess., House Miscellaneous Documents, no. 229 (1890); Tarbell, Ida M., The Tariff in Our Times (New York 1911).

KELLOGG, EDWARD (1790-1858), American monetary reformer. Kellogg was the son of a substantial Connecticut farmer and after receiving an elementary school education followed a business career in New York. He went bankrupt in the financial panic of 1837 but subsequently accumulated a competence and retired to devote himself to plans of monetary reform. His first work, *Remarks upon Usury and Its Effects* (New York 1841), was followed by *Currency: the Evil and the Remedy* (New York 1844, 6th ed. 1846), which was circulated by the aid of Greeley and the *New York Tribune*. His major publication, which passed through many editions, was *Labor and Other Capital; the Rights of Each Secured and the Wrongs of Both Eradicated* (New York 1849). After his death Kellogg's ideas continued to be promulgated by his daughter, Mary Kellogg Putnam, who had collaborated with him and who reissued his writings in many pamphlet editions between 1861 and 1868 under the title *A New Monetary System*. His basic idea was the abolition of interest, the rates of which were extremely high at the time. He suggested that the government issue legal tender notes and loan them on the security of land or other real values at 1.1 percent, which he believed to be close to the usual rate of accumulation of physical wealth in the United States. The government was also to issue bonds bearing the same interest, which Kellogg called "inter-convertible bonds" because they were to exchange freely for the notes. This system, Kellogg believed, would maintain interest rates close to 1 percent, the labor cost, as he calculated it, of carrying on banking. In fact, during the Civil War the government issued bonds which yielded 3.65 percent, and which with the establishment of the national banking system became the basis of banknote currency. Although his proposal of government notes as a substitute for private banknotes did not become a political issue for two decades, Kellogg may rightly be called the father of Greenbackism. Proposals based on Kellogg's theory and put forward by Alexander Campbell, the author of *The True American System of Finance* (Chicago 1864), were endorsed in 1867 by the National Labor Union. Although these proposals favored a 3 percent interest rate, whereas Kellogg desired to abolish interest charges in excess of

banking costs, the improvement over the current bank rates of 8 or 10 percent was sufficient, from the point of view of laborers, farmers and small merchants, to attract considerable support. This endorsement paved the way for the Greenback campaigns of 1872 and 1876; in the latter campaign the Greenback party nominated for president Peter Cooper (*q.v.*), who had long advocated the Kellogg plan. In his view that the process of exchange and the practices of a financing class deprive the producing class, which creates all values, of a full remuneration and in his proposal to eliminate these factors and to base the interest rate on the actual labor cost of running the banking system Kellogg resembled such contemporary European economists as Proudhon.

JOHN R. COMMONS

Consult: Commons, John R., and associates, *History of Labour in the United States*, 2 vols. (New York 1918) vol. ii, p. 119-21; Destler, Chester McA., "The Influence of Edward Kellogg upon American Radicalism, 1865-96" in *Journal of Political Economy*, vol. xl (1932) 338-65.

KELLY, EDMOND (1851-1909), American social reformer. Kelly was essentially the aristocratic humanitarian in politics and one of the few Americans of his class and type to become an avowed socialist. Born in France, he was graduated from Columbia University, practised law for many years in New York and Paris and from 1895 to 1898 lectured on municipal government at Columbia. Kelly was actively interested in the reform of municipal government, as were many men of his type at that time; and in 1892 he founded the City Club of New York, which was to mobilize the forces of "good government" against civic corruption. But the new organization, composed of conservative and wealthy people, rejected Kelly's plan that it organize a series of subsidiary "good government clubs" to appeal especially to workers. Kelly himself organized many such clubs, which contributed powerfully to the defeat of Tammany Hall in 1894. But he was disappointed by the results and concluded that "mere good government in itself did not constitute a platform upon which a political party could be maintained." His disappointment and further intellectual development led him to acceptance of a collectivist philosophy and a mild form of reformist socialism.

Originally an extreme Darwinian and Spencerian with a strong bias against socialism, Kelly subjected the individualist philosophy to severe

criticism; he asserted its validity in the natural world and in primitive civilizations but insisted that it did not imply acceptance of the contemporary program of *laissez faire*: "Man is no longer the mere result of his environment, but can become its master." In harmony with Lester F. Ward, who influenced his ideas considerably, Kelly defined justice as "the effort to eliminate from our social conditions the effects of the inequalities of nature upon the happiness and advancement of man, and particularly to create an artificial environment [government] which shall serve the individual as well as the race, and tend to perpetuate noble types rather than those which are base." Individualism could not offer an adequate program for a complex civilization; Kelly consequently espoused collectivism, which in terms of practical politics meant the municipal and government ownership then popular among reformers. Influenced by Fabian ideas and his own moral approach to the social problem, Kelly a few years before his death concluded that only socialism could "put an end to the three gigantic evils of pauperism, prostitution and crime." His socialism was idealist and evolutionary; an essentially moral appeal for change by means of successive reforms which would "make the Golden Rule practical." It rejected the class struggle in favor of "the whole of democracy, including employer and employee," and favored only partial elimination of competition and a kind of guild organization of industry. Kelly had some influence on men of his class and type but none on organized socialism, although the American Socialist party, despite its Marxist terminology, was in practice close to many of Kelly's ideas.

KEMBLE, JOHN MITCHELL (1807-57), English historian. After leaving Cambridge Kemble visited Germany, where his interest in

philology was aroused and where later he pursued philological studies under Jacob Grimm and others. He gained a reputation, first in England and then on the continent, by his edition of *The Anglo-Saxon Poems of Beowulf* (London 1833) and by the *Codex diplomaticus aevi saxonici* (6 vols., London 1839-48), a valuable if not always accurate collection of documents. His most famous work, *The Saxons in England* (2 vols., London 1849; new ed. by W. de Gray Birch, London 1876), was superseded only by Stubbs. Kemble has been criticized for his exaggerations and many of his theories concerning early European society have since been abandoned; but he will long be remembered as the first writer to make extensive use of Anglo-Saxon charters and as a powerful exponent of the "scientific" methods of Germany. Much of his writing appeared in periodicals and he was for a time editor of the *British and Foreign Review*.

Kemble was an early representative of the "Germanic school" of English nationalistic historians. He protested in the name of scientific accuracy against the liberties taken by romanticists like Scott and Thierry, but his own writings were colored to no small degree by an abounding enthusiasm for the primitive Germans and by a tendency toward a racial interpretation of history. For him the contrast between the turmoil of continental Europe amid the revolutionary upheavals of 1848 and the comparative calm of his own country was explained by England's heritage, particularly in free representative institutions, from Anglo-Saxon times. He believed in the purifying effect of the barbarian invasions on Roman society, the Germanic character of the English people and institutions and the superiority of the German stock to other races. Although lacking both the art and the desire to attract wide popular attention he exerted by his contributions to research a considerable influence on serious students; and because of the character of his views this influence helped develop a nationalist outlook.

KEMPER, JERONIMO DE BOSCH. *See* BOSCH KEMPER, JERONIMO DE.

KENT, JAMES (1763-1847), American jurist. In 1779 after the dispersal of Yale's youthful student body before the approaching revolution-

ary armies Kent, while safe in a Connecticut country village, found and read "with awe" the four volumes of Blackstone's *Commentaries*. Two years later he graduated from Yale and continued the pursuit of the law in a lawyer's office, becoming familiar with Grotius and Pufendorf, with Hale's *History of the Common Laws* and the old *Books of Practice*. Throughout his life a Federalist and an eighteenth century gentleman who methodically read his Greek and Latin classics, in his early days of practise Kent pieced out a living by serving in the state assembly of New York and by lecturing at Columbia College on civil government, constitutional history and the law of nations. In 1798 he entered a judicial career which brought him to the highest offices in New York state.

As a lawyer and a teacher, as judge and commentator, Kent along with Joseph Story became the most influential force in the recreation of American law in the image of Blackstone. Pre-revolutionary American law was a closed record to the lawyers of the new sovereign states. There were no printed colonial reports; the pre-war bar, which had been thoroughly Tory, was discredited and exiled. Kent's postrevolutionary generation accepted literally the dictum of the fathers of the revolution that the rights of the common law, lightly made identic with constitutional rights, were brought to the American shores by the early settlers as the heritage of free born Englishmen. But not knowing what had happened in the law imported in the seventeenth century it accepted the common law of eighteenth century England, so clearly restated in Blackstone. The population was predominantly English, and the habits and thought of the country were receptive to the English common sense embodied in eighteenth century common law. The bench and bar intrenched in Blackstone and schooled by Kent and Story likewise took over the techniques, the procedure and, for the rapidly developing commercial life, the rules of the common law, resisting the blandishments of the civil law despite the pro-French movements after the French Revolution.

As judge Kent introduced in the New York courts the practise of written opinions. At a time when English authority did not stand high he subdued opposition by a plethora of favorable precedents culled from the books; nor did he hesitate to enrich the common law by employing the *Corpus juris*, whose name his republican colleagues ingenuously revered. He was appointed chancellor in 1814 and took to the

moribund Court of Chancery his broad reading in English equity reports; by rearing there a new and powerful court on the English model he joined Story in laying the foundation of equity jurisprudence in the United States.

When he reached the statutory age limit of sixty he retired to a professorship at Columbia College. His lectures, following closely the model of Blackstone, were published as the *Commentaries on American Law* (8 vols., New York 1826-30) and became an authoritative exposition of the English common law from the American point of view and a standard interpretation of the constitution. The chapters on international law were published in England as an independent treatise under the title *Commentaries on International Law* (Cambridge 1866). Kent was particularly fortunate in that throughout his terms on the bench his court opinions were carefully recorded by William Johnson, one of the best of the early reporters, and that a generation after his death the twelfth edition of his *Commentaries* was edited by Oliver Wendell Holmes, Jr. (Boston 1873), making its influence directly traceable into the present century.

KETTELER, BARON WILHELM EMMANUEL VON (1811-77), German social Catholic leader. Ketteler was descended from a noble Westphalian family. He studied law and entered the government service as referendary at the Superior Court in Münster. In 1838 as protest against the imprisonment of the archbishop of Cologne and because "he did not desire to serve a state which demanded the sacrifice of one's conscience" he resigned and under the influence of Reisach, bishop of Eichstätt, turned definitely to the priesthood. From 1841 to 1843 he studied theology at Munich and in 1844 was ordained. He was a member of the Frankfort Assembly in 1848, where he worked with the Catholic group of deputies. In 1849 he became provost of St. Hedwig's in Berlin and in 1850 was ordained bishop of Mainz.

Ketteler was always occupied with political

and social matters. He was considered the adviser of the church in social questions and was recognized by Pope Leo XIII as his great predecessor in the formulation of Catholic social doctrine. Because of his rigidity and inflexibility of mind as evidenced in the *Kulturkampf* he was called the "fighting bishop of Mainz." In his speeches and writings he took a decisive stand for the freedom and autonomy of the Catholic church.

In the first period of his activity Ketteler was influenced by Lassalle in several respects. He was convinced that cooperative societies were a means of solving the social question, and he likewise placed much confidence in profit sharing. On the side of the workers the cooperative movement must of course be pursued in the spirit of Christianity; on the other hand, only genuinely Christian capitalists and manufacturers would be inclined to share their profits with the workers. During this period Ketteler looked upon the supremacy of capital and the rule of economic liberalism as the root of the social problem. They were the source of physical, material and moral disadvantages: the iron law of wages; insecurity of existence; impossibility of progress; the intellectual, moral and physical decay of the life of workers. Here the church alone could be of assistance; otherwise there was no hope of a peaceful solution of the social problem.

By 1869 Ketteler's views on the social question had undergone considerable modification. Although he was still convinced that capitalism should be abolished he realized that producers' cooperatives could never accomplish this end, and he came to recognize the possibility that either the state or the entrepreneur would initiate a policy of social regulation of industry which would mitigate the evils of capitalism and industrialism and result in the improvement of the workers' living conditions. The immediate cause of Ketteler's change in socio-political thought was the publication in 1867 by Alfred Le Roux of a catalogue of social regulations of industry. It was this later position of Ketteler's that determined the direction of Catholic social thought in Germany and which still dominates the Center party. In southern Germany and in Austria, however, there are certain Catholic groups which remain attached to Ketteler's first position; namely, that capitalism as a whole should be discarded.

KEUFER, AUGUSTE (1851–1924), French syndicalist. Keufer was the chief organizer of one of the most powerful labor groups, the *Fédération Française des Travailleurs du Livre*. During the nineteenth century the typographical workers had made various attempts at organization without great results. The congress of 1881 created the federation, which three years later chose Keufer as its secretary general. He retained the office for thirty-six years, from 1884 to 1920; his emphasis on the practical aspects of union activity assured him an ever increasing influence. He took part in the frequently violent discussions which divided the field of labor between the reformists, who favored legal, progressive action, and the revolutionaries, favoring "direct action," that is, force; he was one of the chief representatives of the reformist tendency in the *Confédération Générale du Travail*. Keufer developed his reformist labor philosophy in *L'éducation syndicale* (Paris 1910). He played an important role in the rise to power of the reformist elements in the C. G. T. during and after the World War. Through his own efforts Keufer had acquired a wide range of culture; a disciple of Auguste Comte in philosophical and social questions, he was until his death one of the most active members of the *Société Positiviste de France*. After resigning his office as secretary in 1920 he devoted himself to propaganda on behalf of the League of Nations.

KEY, ELLEN (1849–1926), Swedish feminist. Ellen Key, the daughter of a prominent member of the *Riksdag*, passed her youth in a family environment imbued with cultural interests and

liberal ideas. At the age of thirty-one she began to teach and later to lecture in Stockholm on literature, art and social problems and early in her career became interested in a study of women's rights. Contemporary feminists were laying especial stress on woman's equality with man in all lines of activity and her right to equal rewards. Ellen Key deplored women's indiscriminate competition in what she considered men's work and expressed her creed that women are fitted primarily for motherhood. This apparent retrogression within the ranks brought upon her the bitter antagonism of the feminists. About 1900 she gave up all other work to devote her life to clarifying and spreading her views.

The achievement of equal educational economic and political opportunities for men and women was a necessary goal in Ellen Key's program but not its ultimate purpose. Woman must have opportunity for complete development both because of herself and because of her mission as mother. Monogamous marriage is the most desirable type of union, but love without marriage is preferable to marriage without love. Ellen Key's judicial, unabashed analysis of sex relationships and her fearless prescriptions for improvement resulted in the usual quota of popular calumny, but her principles were always recognized as idealistic. She was an important influence in modifying the nineteenth century hypocrisy and prudery toward sex, and throughout the western world her idealism was an inspiring stimulant to the cause of feminism. Many of her specific aims, such as motherhood insurance, adequate release from industry before and after childbirth, protection and respect for mother and child, either have already been accomplished or are much more possible of achievement than before her crusade.

Ellen Key was an ardent pacifist and worked in close sympathy with the labor movement. Her *Century of the Child*, in which she expressed her views on early training as a basis for future citizenship, established her also as an important influence in educational theory. She believed education to be a vital force in promoting a synthesis of individualism and solidarism.

KEYSER, RUDOLF JAKOB (1803-64), Norwegian historian. Keyser was the first professor of Norwegian history and the Old Norse language at the University of Christiania (appointed in 1828) and the organizer of the university collection of antiquities, which he established on a truly scientific basis by the introduction of a chronological system. In his lectures he developed the new conception of Norwegian origins that became the shibboleth of the Norwegian historical school: the independent origin of the Norwegian nation and the exclusively Norwegian character of the Old Norse literature. His theory concerning the immigration of the Nordic race from the northeast, which was propounded in his program essay of 1839, and his ideas concerning the strength of popular tradition, which led him to the conclusion that the Eddic poems of the ninth century were an inheritance from far off days of national existence and that the sagas of the twelfth and thirteenth centuries contained accurate reproductions of tales going back to the ninth century, have not been able to stand the test of later criticism. But his main contention that the Eddic poems as well as the Icelandic sagas were composed in a language belonging exclusively to the Norwegian race, having neither common Scandinavian nor even pan-Teutonic origins, has proved a permanent contribution to knowledge and has been effective in strengthening the historical self-assertion of the Norwegian people.

As a historian Keyser was overshadowed by his brilliant pupil P. A. Munch. But it was Keyser who formed the firm historical system within which Munch accomplished his work, and of the two he was by far the greater systematizer. It is by virtue of this quality that his works are still valuable to the student. Although

most of his writings appeared in print only after his death in his *Efterladte skrifter* (3 vols., ed. by O. Rygh, Christiania 1866-67) and his *Samlede afhandlinger* (ed. by O. Rygh, Christiania 1868), when many of his theories were already antiquated, his careful collection and evaluation of material, the accuracy of his statements and his lucid presentation of the facts made his works useful and reliable, particularly with respect to the legal system of mediaeval Norway and daily life in old Norway and Iceland. While the scope of his work never extended beyond the national frontiers of Norway, thus excluding comparison with foreign history, he performed his task in an exemplary way and by his systematical thinking and teaching dominated historical thought in Norway for a full generation.

HALVDAN KOHT

Consult: Bugge, Alexander, in Oslo, Universitet, *Det kongelige Frederiks Universitet 1811-1911 festschrift*, 2 vols. (Christiania 1911) vol. ii, p. 224-34; Koht, Halvdan, in *Syn og segn*, vol. ix (1903) 5-13.

KHAMA (c. 1828-1923), South African native statesman. Khama was the last and most famous of the native chiefs who played an important role in the history of South Africa during the last century. Converted to Christianity in early manhood, he from the first took up an uncompromising stand against those customs of his people, the Bamangwato of Bechuanaland, which were repugnant to Christian ideas. When he became chief Khama enforced reforms with an unswerving resoluteness. His most notable achievement was the rigid prohibition of all liquor traffic within his territory. He abolished the official initiation rites for boys and girls and substituted Christian services for the traditional agricultural ceremonies. In his dealings with the Boer and British governments he proved himself a resourceful statesman. He successfully preserved his country at a difficult time from absorption into the South African Republic. Later by means of a visit to England he prevented the passing of Bechuanaland into the hands of the British South Africa Company, which he distrusted, and it became instead a protectorate directly under the British crown. He was able to secure the demarcation of his territory as a permanent native reserve and to keep certain rights of self-government; he also secured the maintenance of native law and custom in administration.

KHMELNITSKY, BOHDAN (c. 1590-1657), Ukrainian national leader. Khmelnytsky was the son of a country gentleman in the Ukraine. He studied in the Jesuit college at Yaroslav and spent several years as a war prisoner in Turkey. Upon his return to the Ukraine he served in the Cossack army then under the control of the Polish Republic. In 1646 he came in conflict with the new administration of the domain of Chihirin, his native town. His property was confiscated and his life endangered. Toward the end of 1647 he fled to the Niz (steppes along the lower Dnieper) and there with other persons out of sympathy with the Polish Republic he conceived the idea of an insurrection (*see* **COSACKS**). He was proclaimed hetman, gained the support of the khan of the Crimea and in the spring of 1648 the Cossack and Tartar troops fought the Polish army sent against Khmelnytsky. At the same time all the Ukraine rose against the Polish nobles; those of the latter who had not time to flee perished and with them great numbers of the Jewish population, many of whom as the fiscal agents of the Polish landowners had aroused the hatred of the Ukrainian people. Khmelnytsky was soon master of the Ukraine. At the outset of the revolution he had no other plans than to insure the rights and privileges of the Cossack army, and he sought to come to an agreement with the Polish government; it was not until 1649 that, under the influence of a group of clergy and savants at Kiev, he conceived the idea of setting up an independent Ukrainian state. The treason of the khan, who withdrew from the war, induced him to seek the protection of the czar in the treaty of 1654. Later, seeing that the czar aspired to the domination of the Ukraine, while the Ukrainian government sought only a military alliance, preserving the sovereignty of the Ukrainian state, Khmelnytsky conceived the project of an alliance with Sweden and with the league of Protestant states headed by Cromwell. Sweden declared war on Poland in 1655 and the alliance of Sweden, Prussia, Transylvania and the Ukraine was formed in 1656. For Khmelnytsky the goal of this war was the partition of Poland among the allies. All Ukrainian territory and the adjacent White Russian territory would be united under the aegis of the Cossack army and its hetman. The king of Sweden, however, abandoned the campaign; the projects of the allies were interrupted; and an opposition to the war against Poland made itself felt among the Cossack troops inspired by Muscovite emissaries

under the pretext that the czar had not given his consent to the projects of the league. The defeat of the campaign had completely disheartened Khmelnytsky. Before his death he had chosen as hetman his son Yurko (George).

KHOMYAKOV, ALEXEY STEPANOVICH (1804-60), Russian Slavophile. Khomyakov, a wealthy landowner, was one of the most erudite and versatile men of his time. He dabbled in poetry and drama, studied and practised rational agronomy and agricultural management and engaged in endless polemics on philosophical, social and historical questions, in which he displayed amazing dialectic skill. His claim to historical significance rests upon his elaboration of the theological aspects of Slavophile doctrine. He postulated religion as the prime motive force in historical development and found accordingly two important types of religion: Cushitism based on the deification of natural necessity and Iranism worshipping the spirit as a free creative will. The purest form of Iranism is Christianity, of which the most genuine expression is the Eastern Orthodoxy free from the rationalism and materialism of the western churches. Khomyakov shared Kireyevsky's faith in the spiritual and historical mission of Russia because he considered its culture to be the least distorted outgrowth of Eastern Orthodoxy; he was critical, however, of many institutions both in pre-Petrine and post-Petrine Russia. Although he was a partisan of autocratic monarchy Khomyakov pleaded for the elimination of restrictions hampering free spiritual development and for the abolition of serfdom, which he regarded as unchristian. Together with Kireyevsky and Samarin he claimed for the peasants a right to the land they worked, basing it upon their original coownership with the landlords; he advocated therefore emancipation with moderate land allotments. In 1842 before Haxthausen discovered the Russian village community for the west Khomyakov developed the idea that the communal land regime was peculiar to the Slavs and particularly to the Russians, and he proposed to retain it even after emancipation as a safeguard against the extremes of concentration and parcellation of landed property. He accepted the peculiar Slavophile concept of *bit*—a complex of

freely developing normative customs as distinct from prescriptions enforced from the outside—but found the elements of *bit* predominant also in English civilization, whose essential conservatism he admired. He believed also that Anglicanism is nearer to Eastern Orthodoxy than either Roman Catholicism or Protestantism and strove for the union of the two churches.

KHRIMIAN, MUGURDICH (1820-1907), Armenian national leader. Educated in his native town of Ván, Khrimian took orders as a monastic priest in 1854. Later he was appointed bishop and from 1869 to 1873 held office as patriarch at Constantinople. In 1878 he headed the delegation sent by Patriarch Nerses Varjabedian to the Congress of Berlin to plead for administrative reforms and was instrumental in obtaining the inclusion in the resulting treaty of the clause which pledged Europe to supervise reforms in Turkish Armenia. Armenian demonstrations upon Turkey's failure to fulfil its promises were answered by massacres. Khrimian was forced by Abdul-Hamid II to retire to Jerusalem in 1890 but in 1893 went to Echmiadzin in Russia as catholicos, or supreme head of the Armenian church, a position he occupied until his death.

Khrimian was one of the outstanding figures in the Armenian intellectual renaissance and was constantly active as teacher, writer and preacher. His main concern was for the welfare of the masses and their emancipation from their oppressors. In religion he was practical, tolerant and undogmatic. He foresaw an era of national activity, and in order that the Armenians might be educated and prepared for their responsibilities he established schools and introduced printing presses. In 1856 he began the publication of *Arđzvi* (Eagle) of Vasburagan, a periodical which sounded a distinct note of national awakening. Around this enterprise Khrimian gathered a group of disciples and collaborators who later took their places as leaders in the nationalist movement. His writings, which are all in Armenian and which include poetry, sermons

and essays, are, unlike other works of the period, entirely free from foreign influences and constitute a notable contribution to the national literature of Armenia.

Mgrditch Khrimian" in *Mercur de France*, vol. lxiv (1906) 181-201; Macler, F., *Autour de l'Arménie* (Paris 1917) p. 240-47; "Khimean and His Prophecy" in Khimean, Meterich, *The Meeting of the Kings*, Armenian text and English translation by P. Tonapeteian and L. Binyon (London 1915) p. 3-9.

KIDD, BENJAMIN (1858-1916), English social philosopher. Kidd, who spent many years in British civil service as a clerk in the inland revenue office, later traveled widely investigating social and economic conditions. In 1898 he visited the United States and Canada and in 1902 South Africa. His social philosophy was a mixture of the antirationalistic strains of romanticist philosophy with the teachings of evolutionary biology. Human initiative and individual reason he believed to be disintegrative forces endangering the very existence of society. He envisaged group restraint, which he regarded as the main condition of social progress, in a mystical manner, discussing the subject with little insight into group or crowd psychology. He contended that since rationalism is individualistic and destructive the governing force in human and social development must be super-rational. This super-rational factor Kidd found to reside in religion, which furnishes the "ultra-rational sanction" for those modes of conduct most conducive to progress. In *The Science of Power* (posthumously published, New York 1918) Kidd further identified religion with the search for the ideal. In his *Social Evolution* (New York 1894, rev. ed. 1920) and his *Principles of Western Civilization* (New York 1902) he appealed to history to justify his conception of social causation and of progress; the result was a man-handling and juggling of historical facts.

Kidd's social theories had a considerable vogue at the turn of the century notwithstanding their meager value as science and logic, because they appealed to the large body of laymen who wished to reconcile religion and evolution. They were not well received by biologists, however, who resented his emphasis on religion and his denial of the value of reason, or by the pious, who were shocked by his characterization of religion as irrational. His *Control of the Tropics* (New York 1898), which realistically emphasized the importance of the tropics and of imperialism

for the future of western civilization, had a considerable effect on the imperialistic policies of Joseph Chamberlain and others.

KIDERLEN-WÄCHTER, ALFRED VON (1852-1912), German diplomat and statesman. At the outset of his diplomatic career Kiderlen-Wächter enjoyed the favor of Bismarck and of William II; but because of his tendencies to unguarded criticism he was removed for a time to minor posts, until under the pressure of diplomatic crisis his services became indispensable. Bülow appointed him acting ambassador to Constantinople during the Young Turk Revolution in 1908 and shortly afterward acting secretary of state of the Foreign Office during the Austro-Russian crisis provoked by Austria's annexation of Bosnia. By urging on Vienna a policy of moderation he succeeded in preventing a diplomatic rupture between Germany's ally and Turkey. In 1910, at the insistence of Bethmann-Hollweg, Kiderlen-Wächter was appointed by the kaiser secretary of state of the Foreign Office. During his two years as trusted adviser to the chancellor he set out to reverse Bülow's policy of subservience to Austria and by emphasizing the independence of German interests and the peculiarity of German needs to make his country the dominant force in the Austro-German alliance. Pursuing a policy similar to that which he had followed in 1908 he met the Austro-Serbian crisis of 1912 with a strong recommendation to Bethmann-Hollweg that the Austro-Hungarian government be made aware, amicably but unequivocally, that Germany was no longer disposed to rubber stamp her ally's actions in the Balkans or the Orient. If Austria wished to insure the continuance of the alliance she must accustom herself to submitting in advance her intended course of action so as to allow Germany opportunity to review it objectively in the light of the particular elements involved. In his efforts to bring about an agreement between Austria and Russia he not only cooperated with Poincaré with a view to French mediation but

conceived the idea, for which Grey was allowed to receive the credit, of establishing the permanent London Conference of the Ambassadors of the Great Powers. Nor did he hesitate, in his eagerness to bring to an end what he considered the aberrations of Vienna's foreign policy, to issue a semi-official statement so direct and outspoken that it brought a protest from Franz Ferdinand, heir to the Austrian throne. This unwavering directness of Kiderlen-Wächter in dealing with the Balkan crisis of 1908 and 1912 has led a number of historians to insist that the "Swabian Bismarck" would have been equally successful in the not dissimilar situation of July, 1914. He was likewise eager to halt Germany's growing isolation by forwarding in opposition to Tirpitz an Anglo-German understanding and by renouncing, as an initial pledge of good will to France, Germany's ambitions in Morocco.

KIDO, TAKAYOSHI (1834-77), Japanese statesman. Kido is known as one of the *Ishin-Sanketsu*, or "three great men," of the restoration, the other two being Toshimichi Okubo and Takamori Saigo. Kido was the son of a physician in the feudal fief of Choshu and he distinguished himself at an early age as a scholar of the Chinese and Japanese classics. The national upheaval caused by the arrival of Commodore Perry and other foreign emissaries demanding trade and intercourse convinced Kido that the shogunate, the military magistracy which had held sway for seven centuries, must be abolished and that the nation must unite under the emperor. This view was heartily endorsed by his feudal chief, the lord of Choshu. As the first step toward accomplishing the task of restoring the imperial regime Kido brought about an entente between the Choshu fief and Satsuma, or Sassi, another powerful fief in the south of Japan. The restoration of 1868 was largely the work of these two fiefs and thus the new government was for many years dominated by the Sassi-Choshu combination. In the new imperial government Kido as well as Saigo and Okubo, both of Sassi, was appointed adviser to the *sosai-kioku*, the prototype of the later cabinet. Kido's most important work is connected with the abolition

of feudalism. He persuaded the lord of Choshu to surrender his fief to the emperor and this example was immediately followed by Sassiu, Tosa and Hizen, resulting in 1871 in the replacement of feudal provinces by prefectures under direct control of the central government. In September of the same year, while he was minister of home affairs, Kido, as a member of the mission headed by Prince Iwakura and including Okubo and Ito, went abroad to find out whether the western powers would agree to the revision of the unequal treaties. The mission returned home in the autumn of 1873 just in time to frustrate the plan to send a punitive expedition against Korea, an action which had been vigorously urged by a powerful group of high officials led by Saigo and Itagaki. After his return from abroad Kido served as home minister and minister of education. He founded the first regular newspaper in the country and was in many ways active in the introduction of western culture into Japan.

KING, GREGORY (1648-1712), English statistician. King was clerk to Sir William Dugdale, the famous antiquary, under whose instruction he laid the foundations of his extensive knowledge of heraldry and genealogy. Later he assisted John Ogilby, the printer, in the production of the well known *Itinerarium Angliae: or, a Book of the Roads* (1675). He was appointed registrar of the College of Arms in 1684 and subsequently Lancaster herald. His work on local genealogy and topography together with his bent toward mathematics suggested to him the possibility of expressing social data statistically. In *Natural and Political Observations and Conclusions upon the State and Condition of England* 1696 he set out his deductions. This treatise was known to his contemporaries and throughout the eighteenth century (to Adam Smith among others) from the sections printed by Charles Davenant in his *Essay upon the Probable Methods of Making a People Gainers in the Ballance of Trade* (London 1699, 2nd ed. 1700). George Chalmers added it to the 1802 edition of his *Estimate of the Comparative Strength of Great Britain* and later published it separately prefaced

by a life of King (London 1804, new ed. 1810).

In estimating the population for the year 1696 King took as a basis the returns from the hearth tax in 1690. After making certain corrections and allowing for an increase of houses at the corrected rate of a thousand a year he arrived at a total of approximately 1,300,000 inhabited houses. He then proceeded to work out a multiplier which would give the average number in a house—a number which he apparently identified with the number in the average family. From the recent assessments levied on births, marriages and burials he calculated that the average varied between 5.5 in London and 4 in villages and hamlets. His ultimate result was a total population of 5,500,000. This is a considerably lower total than that arrived at by Petty, Davenant and Barbon; but statistical estimates made after the introduction of the decennial census in 1801, for example that of Rickman, tend to confirm King's more conservative figure. He estimated the proportion of males to females, the number in each social class and their average income. His calculation of the effect of a decrease in the harvest of corn on the price of corn attracted considerable attention. His figures for the proportion of cultivated to waste land, for the annual amount and value of cereal production and of the wool clip and woollen manufacture, although necessarily based on meager information, are generally accepted as a rough approximation to the facts. King often made pure guesses, but he did so as a careful and disinterested observer. His work is therefore crude from a modern point of view, but it represents an advance over that of his predecessors, for example Sir William Petty, and compares favorably with that of the eighteenth century writers on population, whose work was usually inspired by a polemical purpose.

King's manuscript autobiography (in the Rawlinson collection in the Bodleian library, Oxford) has been printed in James Dallaway's *Inquiries into the Origin . . . of the Science of Heraldry in England* (Gloucester 1793) as appendix ix.

J. F. REES

KING, LEONARD WILLIAM (1869-1919), British Assyriologist. King, who was born in London and educated at Rugby and King's College, Cambridge, spent the remainder of his life as assistant and assistant keeper in the Department of Egyptian and Assyrian Antiquities at the British Museum. He is best known for his *History of Sumer and Akkad* (London 1910) and

his *History of Babylon* (London 1915), of which Rogers gave a fair estimate when he said: "They are immensely learned, rich in citations from the original sources, a storehouse of acute, ingenious, and suggestive observations," but "something less than history as Gibbon would have written it." His importance to the student of the social sciences, however, is to be sought in his other works. In 1896 he began the publication of the *Cuneiform Texts from Babylonian Tablets . . . in the British Museum*, sixteen volumes of which were his own work. The texts published covered every department of knowledge—historical annals, building inscriptions, grammatical texts, hymns, prayers, omens, incantations, epics, myths and above all huge numbers of economic documents. Many of these were published also with translation and commentary. With E. A. W. Budge he edited *Annals of the Kings of Assyria* (London 1902), long the fundamental source for earlier Assyrian history, and with R. C. Thompson *The Sculptures and Inscriptions of Darius the Great on the Rock of Behistûn in Persia* (London 1907), a similar work in the field of Persian history. In *The Seven Tablets of Creation* (2 vols., London 1902) was contained the important creation story which is believed to have influenced the Hebrew account of the creation in Genesis. The *Letters and Inscriptions of Hammurabi* (3 vols., London 1898–1900) showed the Babylonian administrative machine actually at work and illuminated the culture. For the student of the social sciences perhaps the most important of King's editions was his *Babylonian Boundary-stones and Memorial-tablets in the British Museum* (London 1912). The documents in this volume are in reality charters by which weakening kings granted to nobles growing in power exemptions from the usual dues and services; they portray in a striking manner a situation parallel to that in mediaeval Europe—a recent feudal system imposed upon an age old manorial system. Although King himself did little to synthesize the results of his researches, his publications were of service to subsequent social scientists.

Consult: Rogers, Robert William, in *American Journal of Semitic Languages and Literatures*, vol. xxxvi (1919–20) 89–94; Olmstead, A. T., "A History of Babylon" in *American Journal of Theology*, vol. xx (1916) 277–86.

KING, WILLIAM (1786–1865), English co-operator. King, the son of a clergyman, became a physician with a strong interest in the social

reform movements of his day. In 1822 he settled in Brighton, where he became distinguished as an assistant of Mrs. Elizabeth Fry, the philanthropist and prison reformer, and as a supporter of infant schools and mechanics' institutes, at which he frequently lectured.

From 1827 to 1830 King was active in the co-operative movement. He encouraged the Brighton workers to experiment in cooperation and in 1828 issued the *Co-operator*, a monthly magazine financed and written mainly by himself, which was the first to advocate cooperation in language understood by the working class. During the two years of the *Co-operator* King not only stimulated immensely the formation of cooperative societies (three hundred according to his own estimate) but developed a theory of cooperation which has earned him recognition as the first great theorist of modern cooperation. He rejected the philanthropic cooperation of Robert Owen, whose proposals required large capital, which could be secured only from the rich and powerful, and appealed directly to workers to organize cooperatives by utilizing their own economic power and accumulating their own capital. Cooperatives were to pay no individual dividends but to place all profits in a reserve fund for the common good and for purposes of expansion. He advocated producers' cooperatives as a means by which the workers could secure the full product of their labor. While King had no objection to self-sustaining cooperative communities providing they were organized with the cooperators' own accumulated capital he stressed the formation of consumers' and producers' cooperatives within the old society to serve not only the members but the general public as well. The workers could thus gradually dispossess the capitalist class. King ceased publication of the *Co-operator* in August, 1830, owing to dissensions in the cooperative movement over forms and purposes and devoted his later life to philanthropy and reform. His ideas influenced the Rochdale Pioneers and the subsequent development of the cooperative movement; many cooperators feel that King deserves to be called the father of modern cooperation.

W., *Dr. William King and "The Co-operator," 1828–1830* (Manchester 1922); Müller, Hans, "Zweck und Wesen der Genossenschaft, nach Dr. W. King" in *Anthologie des Genossenschaftswesens*, compiled by V. Totomianz (Berlin 1922) p. 18–26.

KING, WILLIAM ALEXANDER (1855–1906), American vital statistician. King first became associated with census work in 1880 and after 1900 was the first chief statistician for vital statistics of the federal Census Bureau. His pioneering activities in this field of government reporting were of particular significance with regard to the collection and treatment of mortality figures, and the lines of development which he laid out are being followed closely today. King made an important contribution in drawing up the standard death certificate, the general use of which in the registration area permitted the collection of uniform basic data on the age, nativity, parentage, marital status and cause of death of decedents. Under his direction the division of vital statistics also adopted the International Classification of Causes of Death. This made possible the statistical presentation under a comparatively small group of clearly defined titles of what had been a vast number of unsatisfactory medical terms and allowed for the comparison of American with foreign mortality experience. At his urging Congress passed in February, 1903, a joint resolution calling on state authorities to cooperate with the Census Bureau in securing a uniform system of birth and death registrations. This was the first important federal recognition of the value of vital statistics as essential to the progress of medicine and sanitary science. King played an important part also in drafting the model law for vital statistics, which a state or municipality was required to adopt before it could be admitted to the federal death registration area. His labors in perfecting the methodology of the vital statistics division, particularly in devising a remarkable system of checks and cross checks, paved the way for the excellent annual mortality reports published since 1900 by the Census Bureau.

KINGSHIP. See MONARCHY.

KINGSLEY, CHARLES (1819–75), English clergyman and social reformer. Kingsley played an active part in the brief life of the Christian Socialist movement in the years following 1848. He was greatly inspired by F. D. Maurice and, like the rest of the group surrounding Maurice, he was deeply excited by the Chartist movement

in Great Britain and the Revolution of 1848 in France. Chartism, however, seemed to him to be on the wrong lines because it was not based on religion and because it was mainly political; he felt that social reform should come through individual regeneration and group cooperation. The attempt of Louis Blanc and others in Paris to create self-governing workshops roused the enthusiasm of Maurice's circle, and the result was the founding of the Christian Socialist movement with the object of establishing cooperative workshops in Great Britain. To the first organ of the Christian Socialists, *Politics for the People* (published from May to July, 1848), Kingsley contributed trenchant articles under the signature "Parson Lot"; in the years 1850 and 1851 he also wrote many articles for the *Christian Socialist*. During the same period he published two novels, *Yeast* (1848) and *Alton Locke* (1850), describing the evil conditions of working class life. His pamphlet *Cheap Clothes and Nasty* (1850), exposing the sweating system, had a wide influence. After the failure of the Christian Socialist movement, however, he dropped out of politics and his views gradually came to be far less radical, although he retained to the end a keen interest in popular education and the development of public health and sanitation.

From 1860 to 1869 Kingsley was professor of modern history at Cambridge, but he was a graphic lecturer rather than an exact scholar and was not regarded as a success. Most of his time was spent at Eversley, where he was rector from 1844 to the end of his life. Besides his political and social works he wrote several novels, notably *Hypatia* (2 vols., 1853) and *Westward Ho!* (3 vols., 1855), children's books and some poetry; and he published many volumes of sermons and essays. He was a vigorous but unskilful controversialist and got much the worst of a tussle with Cardinal Newman. Kingsley's political and economic views were less the result of thought than of strong reaction against evil conditions and of enthusiasm generated by his friendship with Ludlow and Maurice. He was always a social reformer rather than a socialist and had in many respects stronger affinities to toryism than to the radicalism of his day. His contact with the working class movement through Christian Socialism was indeed only an episode in his energetic and varied life as clergyman, novelist, poet, historian, naturalist, educator and "muscular Christian."

G. D. H. COLE

KINGSTON, CHARLES CAMERON (1850-1908), Australian statesman. Kingston began his political career in the South Australian parliament in 1881 as a believer in comprehensive state intervention for social betterment. He was largely responsible for the introduction of woman suffrage, payment of members of parliament, a state bank, progressive land and income taxes, factory regulation, employer's liability and restriction of Chinese immigration. He also fathered the principles of compulsory conciliation and arbitration in labor disputes. The disastrous maritime strike of 1890 convinced him that such "barbarous expedients" should be forbidden, for from them right does not necessarily emerge triumphant. The state must protect non-combatants, who suffer severely, and must attempt to explore what Judge Higgins later called a "new province for law and order." His bill of 1890, by which employers' and employees' organizations could if they wished consent to submit all future disputes to conciliation or arbitration, while the state was to have power of compulsion if necessary, was not passed until 1894 and was never used; but it inspired W. Pember Reeves to similar action in New Zealand, where the first compulsory arbitration act in any country was enacted in 1894. Kingston was a strong advocate of Australian federation. He played a leading part in the drafting of the federal constitution: he was prominent among those who worked out the first draft of a constitution in 1891; he presided over the convention of 1897-98, the work of which was influenced by the preliminary draft; and he participated in the premiers' conference which gave final shape to the constitution. The grant of federal jurisdiction over industrial disputes of an interstate character was originally proposed by him. From 1901 to 1903, when he was the first federal minister of trade and customs, Kingston prepared the first tariff. He also inaugurated a system of

bounties, which, however, was restricted to sugar until 1907.

HERBERT HEATON

Consult: Coghlan, T. A., *Labour and Industry in Australia*, 4 vols. (London 1918) vol. iv, p. 1916-29, 2090-91, 2100-03, 2272-2305; Hunt, E. M., *American Precedents in Australian Federation* (New York 1930); Turner, Henry Gyles, *The First Decade of the Australian Commonwealth* (Melbourne 1911).

KINSHIP. English terms of relationship show diverse principles of nomenclature as to both form and meaning. Formally father and mother are irreducible parts of speech. But such terms as father-in-law and mother-in-law are compounds derived from the rules of canon law as to prohibited degrees, while grandfather and great uncle are formed by adjectival modification of the primary noun. Although in English denotative terms are either primary or derivative, Scandinavian tongues use descriptive as well as denotative terms by describing certain relationships by juxtaposition of the primary relationship terms. Thus the uncle relationship is expressed in the Swedish language by two terms, *farbror*, meaning father's brother, and *morbror*, meaning mother's brother.

English terms also differ in range of application. Father and mother unequivocally designate single persons; but brother or sister may apply to a number of individuals, and cousin has a still wider range. In other words, some terms individualize, other terms embrace a smaller or larger class of persons and they are thus classificatory.

Systems of kinship nomenclature differ in the principles of classification employed and in the relative frequency of principles common to them. Kroeber's investigation in 1909 resulted in a list of categories discoverable from North American data. Kroeber found that kindred are grouped, for example, according to generation or age level as well as to differences between direct and collateral lines of descent. Lexical distinctions might depend on the speaker's sex or on the sex of the relative intermediary between interlocutors. Kroeber argued that such changes and groupings did not reflect social usage but were molded by the psychological factors operative in language generally. This was in avowed revolt against the current view that kinship systems were correlates of social institutions, a principle which was introduced by Lewis Henry Morgan in 1868.

The sociological interpretation of kinship terms antedated the linguistic because anthro-

pologists have been interested primarily in cultural phenomena rather than in linguistic history. Terms of relationship are first of all vocables and what holds for language must ipso facto hold for them; their linguistic history does not differ from that of other words. In Dickens and Thackeray a mother-in-law is sometimes a stepmother, not a spouse's mother; the subsequent restriction in meaning has nothing to do with a change in the social position of stepmothers or spouses' mothers. The change is comparable to the modern restriction in the meaning of the word monogamy as compared with the eighteenth century usage as revealed in *The Vicar of Wakefield*. The French word *tante* was substituted for *Muhme* in the German language and assimilated to native phonetics; the process of borrowing with modification was in no sense distinctive of kinship terms and bore no relation to changes in the German attitude toward aunts. The indifference of the anthropologists to these patent facts of linguistic history has not been due to caprice or perversity. Except in so far as he is avowedly a linguist the social scientist has nothing to do with phenomena of this order, which do not interest him professionally and which he has no special technique for interpreting. As well might an ethnographer try to explain why in some languages nouns for long objects require certain definite articles, nouns for round objects others; or why in color vocabularies dark blue is sometimes classed with black and light blue with green. Anthropological field workers and armchair theorists have grappled with kinship systems solely because these were felt to be correlated with social facts. Sociological interpretations leave a residuum of facts unexplained, however, which are data for philological and psychological scrutiny.

Unhampered by the need for considering all the vagaries of linguistic growth, ethnologists have been able to develop a relatively simple classification of systems. In most European languages individualizing terms for parents occur; and, correlatively, parents apply the term for child only to their own offspring, while siblings differentiate themselves from cousins. The immediate family group is thus sharply differentiated from remote kinsfolk, an emphasis which warrants the term lineal as defining systems that segregate the lineal kin from collateral relatives, who are lumped together as uncles and aunts or cousins. Collateral systems, on the other hand, distinguish not only the collateral from lineal kindred but, at least partly, the maternal from

the paternal collaterals. The Eskimo, the Mono of California and to some extent the Scandinavian languages illustrate these features. A great many peoples, among them the Australians, the Ojibwa and the Iroquois, not only bifurcate collaterals but identify with a parent his sibling of the same sex. Thus there is one term for father and father's brother and another for mother's brother; there is one term for mother and mother's sister and a distinct term for father's sister. By logical correlation tribes using such nomenclatures, which may be designated as collateral merging systems, recognize as siblings the offspring of the paternal uncle or maternal aunt while putting other cousins into a separate category. Generation systems such as those of Polynesia and Micronesia merge all members of the same generation and the same sex under one term.

Morgan and his disciples ignored the existence of all primitive kinship systems except those of the generation and the collateral merging type and thus came to postulate a sharp contrast between primitive and civilized nomenclature and social institutions. Specifically Morgan regarded the generation system of the Polynesians as the simplest of all and accordingly the most ancient. He could conceive only one reason for classing together the father and uncles of both types; namely, that when the terminology originated a man mated with his brother's wife and with his own sister, so that from the children's point of view an uncle was a potential father. Restrictions on the mating of siblings, Morgan contended, crystallized in what is here called a collateral merging system, where the merging of paternal uncle and father meant that a brother still had access to his brother's wife although no longer to his own sister. Monogamy, he believed, evolved ultimately together with the individualizing parent terms of modern terminology. Some of the rudest peoples, however, are monogamous and their kinship terminologies approximate modern European kinship terms. On the other hand, the Polynesians are far from the nascent stages of human society, and their generation system is almost certainly the result of secondary simplification. Similar simplification of terminology has also been noted in Siberia by Sternberg and in America by Lowie. The collateral merging type is evidently consonant with a clan organization, since it links persons of the same clan and separates persons separated by the exogamous rule. If a clan system weakened, the differentiation, for example, between mother's

brother and father's brother might cease to be significant and in extreme cases a generation system might develop, as was shown by Rivers. Morgan was wrong, however, in assuming that the term father in the aboriginal languages necessarily implied procreation. The term merely denotes similarity of status with one's father; many peoples in fact are indifferent to biological paternity. Morgan's specific sociological interpretations were therefore at fault; nevertheless, his intuition that some sort of sociological correlation is involved remains unscotched.

This is in a measure a matter of direct observation. In Australia the studies of Radcliffe-Brown and of Warner have shown that every member of a group stands to every other in a fixed relationship expressed by a pair of kinship terms and correlated with fixed behavior patterns. If a man calls a woman by a certain cousin term, it means that she is a potential wife. The fact that Australians have no terms of affinity is a consequence of their marriage rules, by which every individual must marry a blood relative of some specific class. Apart from such overt instances the moot problem of sociological correlation can be settled by crucial tests based on the logic of varying concomitants. The linguist's challenge is that "the infinitely variable play of the variable factors forbids any true determinations of causality of a sweeping character." If this held true, tribes with or without clans, with maternal or paternal descent, practising or forbidding cross cousin marriage, would have on the average similar systems.

The evidence, however, demonstrates a functional relationship in a mathematical sense between clan organization and collateral merging systems. Collateral merging systems are conspicuously distributed in North America throughout the area of clan organization, with occasional extensions into contiguous tribes. On the other hand, among the Eskimo, around Puget Sound and the Columbia River, in northern California and the Great Basin, that is, among the clanless aborigines, the lineal and collateral nomenclatures hold sway. It cannot be mere chance that those tribes recognizing the family as the foremost social unit are also the ones that stress the immediate kin and segregate them from more remote relatives. On the northwest coast the Kwakiutl have no clear cut clan organization, while other tribes of the same culture area—the Tlinkit, Haida and Tsimshian—have clans; the latter have the collateral merging terminology and the Kwakiutl lack it. Of all the Shoshoneans

the Hopi have the best developed clan organization, and they alone have a typical collateral merging nomenclature. Outside of America the Andamanese, Chukchi and Koryak are clanless and their kinship terms show no trace of collateral merging systems, which are regularly linked with the clan organizations of Australians and African Negroes.

But the phenomena are too complex to warrant the establishment of a simple causal nexus. The alignment characteristic of collateral merging would also result from the combined effect of two widespread forms of marriage, the levirate and sororal polygyny. When a man regularly inherits his brother's widow and takes to wife his first spouse's younger sisters, father's brothers are equated with the father and the mother's sisters with the mother. Since as a rule the tribes with clans also practise these marriage forms, one can merely indicate that an empirical multiple correlation exists without inferring a cause and effect relationship with either the marriage forms or the clan organization.

A special case is presented by that form of clan organization known as the exogamous moiety system. Primitive peoples frequently dichotomize cousins; only cross cousins or the children of a brother and of a sister are distinguished by a cousin term, while parallel cousins, the children of two brothers or of two sisters, fall into the category of siblings. This phenomenon is often linked with the custom of prescribing marriage with cross cousins and tabuing unions of parallel cousins. Tylor showed that this grouping follows from a division into exogamous moieties, where, whether descent is paternal or maternal, cross cousins always are in complementary moieties. On the other hand, the addition of a third exogamous clan no longer inevitably groups cousins in this fashion. The theory fits the cousin classification but is not yet borne out by the empirical data, since the terminology also appears in many tribes lacking exogamous moieties.

Cross cousin marriage, as Rivers showed for Melanesia, is correlated with specific modifications of collateral merging nomenclatures. In cases where the man's maternal uncle and his father-in-law, his mother-in-law and his mother's brother's wife are identified, where he calls wife and female cross cousin by a single word and classes brothers-in-law with male cross cousins, a study of the nomenclature seems sufficient to prove a correlation. Moreover the totality of these equations does not seem to occur

except in regions where the marriage form occurs.

Among the Omaha of Nebraska the generation lines are overridden—a mother's brother's son is called by the same term as a maternal uncle. This feature is not shared by such fellow Siouans as the Crow or Dakota, but occurs among several Central Algonquian tribes. Since, however, these tribes are neighbors, the peculiarity might be explained through diffusion without recourse to social phenomena. But when the same terminological feature crops up two thousand miles to the west among the Miwok of California as well as in Africa and Asia, one must either fall back on the caprices of language, that is, abandon explanation, or look for a common determinant. The latter is found in the common stressing of the paternal line, for all the tribes in question have paternal clans and by paternal descent a maternal uncle and his son will always be in the same clan. For the Miwok and Omaha parallels a perfect answer can be given; both permit a man to marry his wife's brother's daughter—the niece is thus elevated in status, becoming a mother to the offspring of her husband's first marriage, whence her brother becomes a mother's brother. Yet the theory is not adequate; there are tribes like the Ojibwa which are also patrilineal but fail to disregard generation lines.

The reverse occurs in Melanesia, in southern Alaska, among the Crow of Montana, the Pawnee of Nebraska, the Hopi of Arizona and in southeastern United States, where the paternal aunt's son is reckoned a father and her daughter a paternal aunt. All these tribes are matrilineal, so that the father's sister and her children are always in the same group as herself and her brother. But here too a supplementary hypothesis is required, for there are matrilineal tribes, such as the Iroquois, that do not override generations. For the Melanesian and Tlinkit tribes, at least, nepotic inheritance of widows provides the key: a man inherits his mother's brother's widow, hence her children by the first husband call their cousin father. In Dobu, Melanesia, as Fortune has shown, the father's sister's son is verbally identified with the father only after the latter's death; Malinowski found that in the nearby Trobriands the classification obtains from birth. The steps of the development are therefore clear in this area.

Lesser is correct in conceiving such marriage forms as extensions of the sororate and levirate respectively. Where the simple sororate and levirate hold, collateral merging systems adhere

to the generation principle tempered with merging; in cases of extended sororate and levirate the generation principle is correspondingly suspended. The extensions are themselves in consonance with rules of descent; it is not the matrilineal Dobu but the patrilineal Omaha who permit the supplementary wife to come from her predecessor's paternal lineage. In other words, the nomenclature is linked by multiple correlation with a rule of marriage and a rule of descent, which are functions of each other. Furthermore it cannot be inferred that nepotic inheritance of the widow accounts for all the matrilineal cases, since other social factors might yield similar results. Thus if, as in some tribes, a man may marry his wife's daughter by a previous union, a son by the older woman will through the common father be a brother to a son by the younger wife. He is, however, the latter boy's mother's mother's son; that is, a mother's brother. Hence the brother is equated with the mother's brother, so that brother's son becomes the mother's brother's son. Since in collateral merging systems a man's brother's son is designated by the same terms as a son, the son is equated with the mother's brother's son; whence by inversion of the relationship the father becomes the father's sister's son. There is danger therefore of inferring that a particular social factor is the determining principle when some other factor is able to produce like terminological effects, but this does not militate against the theory of sociological determinism.

The empirical correlations found in Australia are convincing. Radcliffe-Brown discovered that wherever the designations of the mother's mother's brother and the father's father coincided, the tribes practised cross cousin marriage and were segmented into four sections; where these relatives were distinguished, marriage was with a cousin of more remote degree—the mother's mother's brother's daughter's daughter—and there were eight sections.

In summary, kinship terminologies cannot be wholly interpreted along sociological principles because of the whimsicalities of linguistic usage. Diffusion may likewise prove a distorting agency; it is conceivable that special features may sometimes be borrowed independently of existing social phenomena, even if one admits that frequently traits of nomenclature are borrowed that are congruous with the existing social scheme, as Thurnwald contends. Apart from phenomena which are at present inexplicable, it must be recognized that coexisting social factors may

compete in the shaping of a given system and that generally insight into the relative importance and chronology of these factors is lacking. Notwithstanding such difficulties clear cut empirical correlations between kinship terms and social organization appear; in fact no other branch of culture so definitely illustrates two principles of major theoretical significance: the occurrence of regularities and the possibility of convergence.

KIRBY, JOHN, JR. (1850-1925), American industrialist. A manufacturer and director in many small corporations, Kirby was one of the conspicuous advocates of the open shop and an organizer of anti-union employers' associations. He was instrumental in evolving a new and effective type of employers' association consisting of employers in different industries in the same city. The Dayton Employers' Association formed in 1901 under Kirby's leadership actively promoted similar associations in a number of middle western cities, the general object being to resist or to eliminate strong unions. Through these associations a number of defeats were inflicted upon unions, notably in Chicago and Indianapolis. At the meetings of the National Association of Manufacturers in 1902 and 1903, when that association for the first time adopted a belligerent anti-union program, Kirby was one of the principal orators on behalf of such a course. Indeed he wanted to alter and enlarge the association, to make it a general federation including not only manufacturers but all types of employers, for the purpose of spreading the open shop. This move was defeated and instead Kirby helped to organize the Citizens' Industrial Association of North America, which for several years was prominent in the open shop movement. In 1909 he was elected president of the National Association of Manufacturers and followed closely in the footsteps of his belligerent predecessors, Parry and Van Cleave. He served until 1913. During Kirby's administration anti-union feeling ran high in connection with the trial of the union ironworkers for dynamiting the Los Angeles Times building, and he used these events to "prove" that the American Federation of Labor was "a cold, merciless and murderous labor trust." Under his administration the lobbying activities of the National Association of Manufacturers, organized by his predecessors, continued until exposed by a congressional investigation in 1913. Kirby was also active in the National Metal Trades Association and in 1916 became a charter member of what is now the National Industrial Conference Board.

Kirby's presidential addresses are remarkable for their emotional fanaticism and for a picturesque use of Biblical metaphor. A more re-

strained statement of his ideas is to be found in an article on industrial combinations (American Academy of Political and Social Science, *Annals*, vol. xliii, 1912, p. 119-24). He concedes the theoretical desirability of labor combinations for improving the moral, intellectual and pecuniary condition of members if they confine themselves to "fair" methods, by which he means methods other than violence, strikes and boycotts.

KIRCHMANN, JULIUS HERMANN VON (1802-84), Prussian philosopher and sociologist. After attending the universities of Leipsic and Halle Kirchmann entered the civil service. He was prosecuting officer of the Berlin criminal court and later vice president of an appeal court; he was removed from the latter post in 1867 for advocating birth control as the solution of the social problem. In 1848-49 he was member of the Prussian Diet for Berlin, sitting in the left center led by Rodbertus, and from 1871 to 1876 a member of the Progressive party in the Reichstag. Championing "common sense" in politics Kirchmann first stigmatized the Prussian and Imperial Diet systems, which through a cunning arrangement of franchise and constituencies reduced parliament to a tool of the crown, as *Schein-Constitutionalismus* (sham constitutionalism). He opposed republican ideas in 1848 and advocated a combination of authority and democracy by means of a parliamentary government assisted by a well developed civil service; the standing army was to be replaced by militia. His pamphlets on economics provoked the famous *Sociale Briefe an von Kirchmann* (3 vols., Berlin 1850-51) of his friend Rodbertus. He rejected Hegel's dialectic, accepted Kant's critique of knowledge and inclined to positivism; in his later years he was much interested in Comte and tried to introduce sociology as a systematic science into Germany. As the author of several works on criminal and procedural law he startled the legal world as early as 1847 by proposing to free legal science from obsolete logical and verbal methods, which he characterized as unscientific. He proposed to make of the law a real science by adopting what he called political method. His position in this respect was very close to that of the modern sociological school of jurisprudence.

He wrote many philosophical works, edited *Kirchmanns philosophische Bibliothek* and was for many years president of the Berlin Philosophical Society and a frequent contributor to its publications. A sensualistic realist, Kirchmann regarded sentiment or respect for authority—parents, teachers, state officials, priests, the monarch, the sovereign people—as the basis of morals; the highest authority being God, who exists as a feeling if not as a reality. Religion is a great power for good and evil among the masses; evil—oppression rather than superstition—may be avoided through religious freedom. Morality is a personal not a public matter; political science is concerned only with determining the reasonableness of government.

KIREYEVSKY, IVAN VASILYEVICH (1806-56), Russian Slavophile. As a young man Kireyevsky was strongly indoctrinated with German idealistic philosophy. In 1827 together with his younger brother Petr, who later gained prominence as a collector of folk songs and who exerted a profound influence on Ivan's development, he joined a discussion circle led by the poet Venevitinov and the novelist prince Odoevsky; the members of this group were young Schellingians who repudiated the revolutionary legacy and viewpoint of the Decembrists. Kireyevsky's first important work was a penetrating appraisal of Pushkin's poetry, which was followed by a brilliant article on Russian literature in 1829. After a short sojourn abroad he founded in 1832 the *Evropeyets*, a review which enjoyed the cooperation of the best Russian writers but was suppressed after the second issue. In this review he objected to the cultural isola-

tion of Russia and advocated the adoption of western education. Shortly thereafter his outlook changed radically: he became a devout follower of the Russian church and plunged into a study of patristic literature. Thus arose the peculiar fusion of Hegel and Schelling with Eastern Orthodox theology which is embodied in the philosophy of Slavophilism, formulated for the first time by Kireyevsky. The main outlines of this philosophy were sketched by Kireyevsky not later than 1839, but its amplified presentation appeared in print only in 1852 in the columns of *Moskovsky sbornik*, a magazine which he edited.

The focal point of Kireyevsky's Slavophilism is the conception of *bit*—a system of spiritual values and social relations shaping themselves independently of human calculations. Russian *bit* escaped the influence of the three most important institutions of western Europe: the Roman Catholic church with its extreme emphasis on logic, which inhibits the living understanding of inner spiritual life and the unbiased contemplation of outward nature; the juridical legacy of ancient Rome, which reduces the individual to a bundle of absolute property rights; and the political organization born of conquest. Underlying Russian *bit* is the living spiritual philosophy of eastern church fathers, which sublimates the rational-mechanical reason to a morally free speculation and is responsible for the characteristic features of Russian social organization, of which the primary foundation is the living individual. The land in Russia belongs to the community, because the latter consists of families composed of individuals who can till it, while the landlord's right is conditioned by his relation to the state. The principal cause of all evils and shortcomings in Russian life is the conflict between the true Russian civilization, which is not to be identified with petrified Byzantinism, and the cultural elements borrowed from the west. The remedy lies not in a wholesale repudiation of western rationalism and science; Kireyevsky and other Slavophiles advocated instead a rather mystical synthesis of western culture with eastern Christianity.

KIRK, SIR JOHN (1832-1922), British colonial agent. Kirk studied botany and medicine at Edinburgh University and was selected to accompany David Livingstone on his official Zambesi expedition from 1858 to 1863. From 1866 to 1887, in the service of the Foreign Office and the government of India, he represented British commercial, philanthropic and political interests at Zanzibar, where he acquired a dominant position as the trusted friend of the Arab sultan Barghash. In this capacity and later as a director of the Imperial British East Africa Company he helped to lay the foundations of British rule in Uganda and Kenya. At this time the slave trade was flourishing on the east coast of Africa, mainly in the hands of the Arabs, who devastated central Africa from their base at Zanzibar. Like Livingstone, Kirk was deeply impressed by the evils of the traffic and next to him was the chief means of ending the scourge; he became the chief agent of the British government in pressing for outlawry of the trade. Largely through his influence Barghash was persuaded in 1873 to prohibit all export of slaves and to close all public slave markets throughout his dominions. Kirk headed the British delegation at the Brussels Conference of 1889-90 which outlined the system for exterminating the interior slave trade, and it was he who suggested the method adopted by the British in various parts of Africa for the abolition of slavery itself. This method deprived the institution of legal status but avoided the dangers of compulsory emancipation. The younger generation of African administrators long regarded Kirk as the wisest exponent of British traditions in colonial policy.

KISELEV, PAVEL DMITRIEVICH, COUNT (1788-1872), Russian statesman. After a brilliant military career Kiselev was appointed head of the provisional government of Moldavia and Wallachia, territories which were temporarily occupied by Russia after the Russo-Turkish War

of 1828-29. While there he enacted important administrative and social reforms and was largely instrumental in liberating the peasants from the feudal power of the landowners. Upon his return to Russia in 1834 he was appointed member of the Council of State and in 1838 was entrusted with the administration of peasant serfs on the state domains. Kiselev introduced self-government in the villages, augmented the size of land parcels, improved the methods of agriculture and increased the number of schools. Although the peasants rebelled against the excessive bureaucratic regulation, their condition was generally improved. Along with these reforms Kiselev applied himself to the task of preparing the emancipation of all Russian peasants. Russia at the time was already entering upon a period of capitalistic development and the continuance of feudal relations was a retarding factor in the tempo of industrial expansion. Nicholas I recognized the necessity of freeing the peasants and lent a willing ear to emancipation projects. The majority of landowners were opposed to emancipation, and others approved the freeing of the peasants without giving them any land. Kiselev evolved a plan according to which the peasants would be given personal freedom and the landowners would remain in legal possession of the land, subject, however, to the obligation of granting the peasants an inalienable lease on a definite parcel of land in return for definite dues, the size of the parcel and the amount of payment to be fixed by law. Under the pressure of the opposing landowners, however, the plan was deprived of its compulsory features and when finally enacted in the ukase of 1842 it remained practically a dead letter. With the liberation of the peasants in 1861 the plan became obsolete. Kiselev was appointed ambassador to Paris in 1856 and retired from public life in 1862.

KISTYAKOVSKY, ALEXANDER FEDOROVICH (1833-85), Russian criminologist. After studying at the University of Kiev, where he was later professor of criminal law from 1864 until his death, Kistyakovsky complemented his university studies abroad and investigated the leading penal institutions of Europe. His approach to the problems of criminal law was from the point of view of the positivism of Auguste Comte; with a broad humanitarian outlook he

emphasized the environmental determinants of crime and society's responsibility for the criminal. He believed that laws must be studied historically in relation to the social conditions prevailing at the place and time of their origin and that criminal law, first motivated by revenge and then by a desire to intimidate the criminal, should be directed toward social reform and prevention. Opposed to capital punishment he urged more humane treatment of juvenile delinquents through such methods as that adopted in Rubeshevsky's colony for young offenders, attacked the severe administrative penalties which at that time were in wide use in Russia and defended the interests of accused persons in the spirit of modern criminal procedure. He wrote on the legal history of the Ukraine and brought the theories of foreign criminologists to Russian audiences. For many years he was president of the Legal Society of Kiev, which he founded and for which he prepared a program advocating measures of legal reform.

M. CHUBINSKY

KISTYAKOVSKY, BOGDAN ALEXANDROVICH (1868-1920), Russian sociologist and jurist. Kistyakovsky lectured at the College of Law at Yaroslavl from 1907 to 1916 and from 1916 to 1920 was professor at the University of Kiev. He was editor of the *Uridichesky vestnik* from 1911 to 1917. A disciple of Simmel, Windelband and Rickert, Kistyakovsky was one of the most able representatives of the neo-Kantian movement in Russia. From the naturalistic and organic point of view his sociological criticism, particularly of Spencer's system, had considerable repercussion not only in Russia but also in Germany. Likewise his analysis of the method of the Russian subjective school of sociology (Lavrov, Mikhaylovsky and Kareyev) must be regarded as a classic. In the theory of law Kistyakovsky developed a consistent methodological

pluralism. He insisted on the necessity of distinguishing four different conceptions of law, each of them corresponding to one of the aspects of objective juridical reality: the dogmatic and etatist conception of law, which is based on a procedure of formal classification; the sociological conception; the psychological conception; and the normative philosophical conception. He maintained that these four conceptions, each of which is upheld by some jurists as the only correct one, represent abstractions of single aspects of law, the fundamental unity of which can be best seen when it is regarded as a *Kulturgut*, an element of culture spiritualized and imbued with values. Thus Kistyakovsky as distinguished from the German neo-Kantians was able to break completely through the confines of juridical positivism, to appreciate in its entirety the importance of the movement toward the "living law" and "free law" and to emphasize the role of the dynamic and irrational in juridical reality.

KIUPRILI FAMILY. *See* KÖPRÜLÜ FAMILY.

KJELLÉN, RUDOLF (1864-1922), Swedish political scientist. Kjellén was professor of political science at the University of Göteborg from 1890 and at the University of Uppsala from 1916. He began his career with a series of papers and books on constitutional law which show the conservative and orthodox influence of his master, Oscar Alin. But the great political events of the last two decades of the nineteenth century, the beginning of the era of imperialism and the study of Ratzel's *Politische Geographie* (1897), which impressed him deeply, revealed to him the inadequacy of the purely juridical view in political science. He therefore made it his life work to achieve a fuller comprehension of states as powers in action in the theater of world politics. Such a conception involved an empirical study of the resources material and spiritual possessed by each of the powers. In his first great work, *Stormakterna* (1905), he made a realistic analysis of the participants in the game of great powers that led to the World War.

After collecting this material Kjellén set about the task of constructing a new biological system

of political science, the principles of which are most fully expounded in *Staten som livsform* (1916), and *Grundriss zu einem System der Politik* (1920). In designating his study *Politik* he uses the term not in the sense of practical political action but in the Aristotelian sense of a science of the state, which for Kjellén is a science of the state considered as an organism whose principal attribute is power. There are five aspects of this study. *Demopolitik* is an investigation of the population and of its physical and mental characteristics as a race and nation. *Sociopolitik* analyzes various classes, professional groups and other elements which comprise the social structure of the population. *Kratopolitik* deals genetically and realistically with the governmental organization and constitutional forms through which the state expresses its active will. While these three categories represent the endogenous elements in the state's power, it is the exogenous elements which constitute the subject of the two final categories, *Geopolitik* and *Oekopolitik*. *Geopolitik*, manifesting in its conception the direct influence of Ratzel, aims to analyze those problems and conditions of life in the state which arise from geographical factors and natural environment. *Oekopolitik* studies the economic exploitation of the nation's resources, in so far as such activity directly or indirectly affects the power of the state. In his monograph, *Sverige* (1917), Kjellén illustrated his system by applying its principles and method to a study of Sweden. Nearly all of the individual components of his theory had appeared in some form or other in the doctrines of previous political scientists, economists or geographers, but the system as a whole is one of great originality. Its influence in Germany has been even greater than in Sweden, although it has affected political scientists of the juridical type less than historians and geographers. In pursuing Kjellén's method the Germans have somewhat neglected the other aspects of his system in favor of his *Geopolitik*, which has developed into a kind of popular catchword.

WALTHER VOGEL

Important works: *Stormakterna*, 2 vols. (Stockholm 1905; 2nd ed., 4 vols., 1911-13); *Samtidens stormakter* (abr. ed. of *Stormakterna*, Stockholm 1914), German translation by C. Koch as *Die Grossmächte der Gegenwart* (Leipzig 1914; 22nd rev. ed. by Karl Haushofer as *Die Grossmächte vor und nach dem Weltkriege*, 1930); *Stormakterna och världskrisen* (new rev. ed. of *Samtidens stormakter*, Stockholm 1920), German translation by W. A. Berendsohn as *Die Grossmächte und die Weltkrise* (2nd ed. Leipzig 1921); *Staten som livsform*

(Stockholm 1916), German translation by J. Sandmeier as *Der Staat als Lebensform* (4th ed. Berlin 1924); *Grundriss zu einem System der Politik* (Leipzig 1920); *Sverige* (Sweden) (Stockholm 1917); *Politiska essayer*, 3 vols. (Stockholm 1914-15); *Världspolitiken 1911-19* (Uppsala 1920).

KLEIN, FRANZ (1854-1926), Austrian jurist. Klein gave up his practise as a barrister in 1885 to lecture on the Austrian law of civil procedure at the University of Vienna. He soon became prominent as a jurist and literary spokesman of the reform movement in this field. Called to the ministry of justice, he drafted the Austrian code of civil procedure of August 1, 1895, which came into force January 1, 1898. It is acknowledged to be one of the best in the world. Its outstanding ideas are publicity, directness and, above all, the oral method of procedure. The administration of justice is adapted to social needs. It is made possible to manage a legal action expeditiously and with little expense. The law of May 27, 1896, relating to the execution of judgments, which is also Klein's work for the most part and which went into effect at the same time as the code of civil procedure, aims to spare the debtor as much as possible and endeavors to prevent the destruction of values. After he had instituted his procedural reforms Klein became minister of justice for several years. The profound social reference which guided Klein in all his scientific and reformatory activity is evident also in his work for the protection of youth, which takes account of social factors; in his solicitude for proper housing, which he greatly advanced by his law of 1912 regarding building rights; and in his writings. Among the last should be mentioned *Pro futuro* (Vienna 1891), *Mündlichkeitstypen* (Vienna 1894), *Die psychologischen Quellen des Rechtsgehorsams und der Rechtsgeltung* (Berlin 1912), *Das Organisationswesen der Gegenwart* (Berlin 1913), *Der Zivilprozess Oesterreichs* (ed by Friedrich Engel, Mannheim 1927). After the World War Klein, who was an unswerving champion of the larger German unity, concerned himself with juristic problems growing out of the peace treaties. He was undoubtedly one of the greatest jurists of Austria.

Consult: Sperl, Franz, in *Jherings Jahrbücher für die*

Dogmatik des bürgerlichen Rechts, vol. lxxviii (1927-28) v-xxxvi; Benedikt, Edmund, in *Neue oesterreichische Biographie*, ed. by Anton Bettelheim, 7 vols. (Vienna 1923-31) vol. iv, p. 9-30, and further bibliography there cited.

KLUCHEVSKY, VASILYI OSSIPOVICH (1841-1911), Russian historian. Kluchevsky, the son of a poor village priest, was born in the province of Penza. He prepared himself for the clergy in the local schools but under the influence of the growing radical movement renounced his clerical career and entered the University of Moscow in 1861, the year of the emancipation of the serfs under Alexander II. The impression of this event, which he retained throughout his life, was responsible for his decision to study the history of the social classes in Russia in the light of Russian economic development. Although, as Kluchevsky himself declared, he owed his general view of Russian history to his teacher Soloviev, to whom he was indebted also for much of the material he used, Kluchevsky's work represents a distinct advance over that of his teacher. He studied historical processes from a sociological point of view; general schemes and interpretation were to him more important than the mere accumulation of factual material, and he emphasized especially the modifying influences of geographical factors. Above all he represents the synthesis of the two previous schools of history: the westernists, who saw in Russian history a development parallel to that of western Europe; and the Slavophiles, who emphasized the peculiarities of Russian development.

Kluchevsky's first important work was his doctoral dissertation, *Boyarskaya дума древней Руси* (Duma of boyars in ancient Russia, Moscow 1882, 4th ed. 1909), in which he traced the causal connection of this institution with the economic and social processes. Following this came monographs on the history of Russian serfdom and especially on the origin and composition of Russia's earliest representative assemblies. In the latter study Kluchevsky disproved the existing theory of the *sobor* as an elected assembly of the people and showed that it was recruited by official selection of the ruling power. His most important work was his *Kurs russkoy istorii* (Course of Russian history, 5 vols., Moscow-St. Petersburg 1904-21; tr. into German by R. von Walter, 4 vols., Stuttgart 1925-26, and an abridged translation into English by C. J. Hogarth, London 1911-31), which was prepared from his course of lectures at the

University of Moscow and which extended to the reign of Nicholas I. His talent for microscopic analysis of the evolutionary processes in history is successfully blended with one for vivid synthesis and an intuitive grasp of the psychology of the past. He considered colonization to be the distinctive feature of Russian development and looked upon the stages of colonization as marking the divisions of Russian history. As he reached the more modern period his sympathetic approach weakened and he became critical of the borrowings from western Europe. He drew attention to the mechanical and external side of the Europeanization of Russia by Peter the Great and turned his wrath especially against the nobles and serf owners whose unconsidered imitation of the west destroyed the unity of Russian cultural evolution.

Kluchevsky was in full sympathy with the constitutional movement in Russia and as early as January, 1905, soon after the "red Sunday" predicted the fall of the Romanov dynasty. He was a member of the Constitutional Democratic party (Cadet) and foresaw the victory of the revolutionary movement as a consequence of the government's breach with the moderate majority in the Duma.

KNAPP, GEORG FRIEDRICH (1842-1926), German economist. Knapp was a student of Helferich at the University of Göttingen and attended Engel's statistical seminar at the University of Berlin. In 1869 he was appointed head of the municipal statistical office of Leipsic. After teaching at the University of Leipsic for many years he was appointed professor of economics at the University of Strasbourg, where he remained until the closing of the German schools in 1918.

Knapp started his scientific career as a statistician. He investigated the methodological principles of population statistics and was the first to formulate a systematic theory of mortality measurement. Opposing the viewpoints of Quételet and his followers, who claimed that man's behavior is governed by statistical "laws," he viewed statistics simply as a tool in the

realistic study of the manifold social phenomena and fully realized the limitations of statistical observations.

In the *Bauernbefreiung und der Ursprung der Landarbeiter* (2 vols., Leipsic 1887), a product of the second period of his scientific activity, Knapp displayed excellent workmanship in elucidating the development of agrarian organization in Prussia. He analyzed the two forms of manorial organization, the *Grundherrschaft* (landlordship) and the *Gutsherrschaft* (estate ownership), and viewed the latter as a capitalistic form of land utilization engaged in production for market. The hereditary vassalage of the peasants represented the labor system peculiar to the large agricultural estates of the time. The abolition of feudal relations, which Knapp described in detail, did not eliminate the large estates but rather strengthened their position. The introduction of the new system of free wage labor, however, necessitated a wide readjustment in agricultural organization and provided the background for the subsequent measures of rural reform.

Knapp's last major work, *Staatliche Theorie des Geldes* (Leipsic 1905, 4th ed. Munich 1923; tr. by H. M. Lucas and J. Bonar, London 1924), aroused a storm of controversy, in the course of which his doctrines were considerably distorted. According to Knapp money derives its validity not from the intrinsic value of the metal out of which it is made or which it represents, but from the function as a means of payment assigned to it by an act of state. His "chartalism," a version of the nominalistic conception of money, considered paper money to be a regular and legitimate form of money. Knapp did not, however, advocate an arbitrary issue of notes or a general abolition of the gold standard. He set strict economic limits to the issue of notes by the state and recognized some of the advantages of a metallic standard, particularly as a stabilizing factor in foreign exchange.

While Knapp deliberately refrained from direct participation in public affairs he exerted a profound influence from his university chair. His contributions to statistical methods were incorporated into official statistics and his seminar at the University of Strasbourg—at times in collaboration with Schmoller and Brentano—became the center of studies in political economy. The work of the seminar is contained in the thirty-four volumes of *Abhandlungen* edited by Knapp.

FRANZ GUTMANN

Important works: *Über die Ermittlung der Sterblichkeit*

aus den Aufzeichnungen der Bevölkerungsstatistik (Leipsic 1868); *Die Sterblichkeit in Sachsen nach amtlichen Quellen dargestellt* (Leipsic 1869); *Theorie des Bevölkerungswechsels* (Brunswick 1874); *Einführung in einige Hauptgebiete der Nationalökonomie* (Munich 1925). This work contains, in addition to a number of articles, the papers *Landarbeiter in Knechtschaft und Freiheit* (Leipsic 1891) and *Grundherrschaft und Rittergut* (Leipsic 1897), which had previously been published separately.

KNAPP, MARTIN AUGUSTINE (1843-1923), American interstate commerce commissioner, federal judge and railroad labor mediator. Knapp practised law for many years but the later portion of his life was devoted to the federal public service, primarily in connection with railroad regulation. Appointed a member of the Interstate Commerce Commission by President Harrison in 1891, he served on the commission continuously from 1891 to 1910 and as its chairman from 1898 to 1910. He resigned to accept a circuit judgeship and to serve as presiding judge on the newly created United States Commerce Court, which was abolished in 1913. From the beginning of his chairmanship of the commission he also served as mediator in railroad labor disputes, first ex officio under the Erdman Act of 1898 and later through appointment by President Wilson to the Board of Mediation and Conciliation which was created by the Newlands Act of 1913.

Knapp exerted great influence upon the strengthening of the Act to Regulate Commerce and upon the commission's early exercise of its new powers. By 1898 much of the administrative authority assumed under the original statute had been invalidated by judicial decision; and the commission under his leadership urged repeatedly and forcefully that it be vested with rate making power and that the procedure for the enforcement of its orders be so changed as to recognize the dominance of administrative control. These results were achieved in 1906 by the Hepburn Act as construed by the commission and as sustained by the Supreme Court. The attempt of the Commerce Court, over which Knapp presided during its short history, to exercise broad powers of judicial review appears out

of harmony with his experience and attitude while a member of the commission; but these controversies, which were generally resolved by the Supreme Court in support of the commission, served the important purpose of securing an authoritative definition of the respective spheres of administrative and judicial jurisdiction. As a mediator in railroad labor disputes he participated in numerous settlements and exhibited an informed understanding of the demands of the carriers and their employees; but the inadequacy of the legislation under which he and his colleagues were required to act was disclosed by their helplessness in the nation wide dispute of 1916, as a result of which Congress by the passage of the Adamson Act virtually set itself up as an arbitration tribunal.

While his service in all these spheres was never independent but always in cooperation with others, Knapp unquestionably played an important role in the development of the principles and practises of railroad regulation by the federal government.

I. L. SHARFMAN

KNAPP, SEAMAN ASAHIEL (1833-1911), American educator. Knapp was largely responsible for the development of agricultural extension education in the United States. For six years he was associated with the Iowa State Agricultural College and for three years was editor of an agricultural magazine. He studied agricultural problems in Japan, China, the Philippine Islands, India and Porto Rico from 1898 to 1902 under the direction of the United States secretary of agriculture. From 1902 to 1910 he was in charge of the work of the Department of Agriculture in demonstrating the value of co-operative enterprise to southern farmers.

The essence of this work is demonstration carried out by the farmers under the direction of a specialist known as county agent or home demonstration agent. Efforts to educate farmers by laboratory method similar to that used in training physicists or chemists had been tried by several agricultural colleges before Knapp launched his program. It was, however, due to his promotion work, begun in Texas and Louisiana, that the principle became the object of a nation wide organization which has helped greatly to improve conditions of rural life in America.

EDWARD WIEST

Consult: Martin, O. B., *The Demonstration Work* (Boston 1921).

KNIBBS, SIR GEORGE HANDLEY (1858-1929), Australian statistician. Knibbs, who was born in Sydney, began his career as a surveyor; after 1889 he lectured on engineering and in the year 1905-06 he was acting professor of physics at the University of Sydney. In 1902 he was appointed one of the commissioners on education and in 1905 commissioner on technical education for New South Wales. In 1906 he was selected to create the Bureau of Statistics for the Commonwealth of Australia, which he directed until 1921. As commonwealth statistician he coordinated the work of the existing statistical bureaus of the states and organized publications to present material gathered by the states together with data pertaining directly to the commonwealth. Of these publications the most comprehensive is the *Official Year-Book*, of which the first volume, issued in 1908, contains corrected statistics for the period from 1788 to 1900, authoritative statistics for the years 1901 to 1907 and a history of Australian statistics. Knibbs was most attracted to those branches of statistical work which offered the greatest scope for mathematical exposition, particularly the study of population and index numbers. His outstanding work is *The Mathematical Theory of Population* (Melbourne 1917) printed as an appendix to the first volume of the report on the Australian census of 1911, the first to be undertaken by central authority. It deals with general mathematical technique in statistics and its application to special problems of natality, masculinity, nuptiality, fertility, mortality and migration; many new methods are expounded including the extremely flexible curve $y = Ax^{me^{nzp}}$ and secular trends of mortality. His work on index numbers is incorporated in the reports of the bureau's Labour and Industrial Branch, of which *Report* no. 1 (1912) and no. 9 (1919) are particularly important. He also devised the mathematical formulae on which the Australian land and income taxes are assessed. From 1921 to 1926 he directed the Institute of Science and Industry, which commenced under his guidance a number of important industrial research projects. Shortly before his death he published *The Shadow of the World's Future* (London 1928), in which he stressed the danger of overpopulation.

E. T. MCPHEE

KNIES, KARL GUSTAV ADOLF (1821-98), German economist. Knies was professor of economics at the University of Freiburg i. Br. and

from 1861 to 1865 represented the university in the diet of Baden, where he was leader of the liberal party in its struggle with ultramontaniam. In 1865 he was appointed professor at the University of Heidelberg, where he remained until his retirement in 1896.

Knies, one of the chief exponents of the historico-ethical school in economics (see ECONOMICS, section on HISTORICAL SCHOOL), was influenced by Hegel's philosophy of history and in his turn exercised a profound influence on Schmoller and other social reformers in Germany. He conceived economics as belonging neither to the natural sciences nor to the mental sciences but to the group of historical disciplines which have for their object the study of man in society in terms of its historical growth. The aim of economics as outlined in his theoretical work *Die politische Ökonomie vom Standpunkt der geschichtlichen Methode* (Brunswick 1853; 2nd ed. as *Die politische Ökonomie vom geschichtlichen Standpunkte*, 1883) is to trace the causal factors underlying economic phenomena with a view to establishing laws of development and formulating generalizations for each successive stage of economic life. As economic phenomena have no independent existence of their own they can be understood only when studied in their interrelation with the other aspects of social life, of which they form an intimate part. Only when this approach is taken does it appear that man is not motivated exclusively by self-interest; other fundamental instincts are the sense of membership in the community and the sense of justice and equity. Consequently abstraction from ethical and social considerations, as exemplified in deductive economics in England, leads to erroneous conclusions which if made the basis for economic conduct may endanger the harmonious development of society. As the state is the embodiment of both the economic and the ethical aspirations of the nation, it is its duty to interfere in economic life in order to counteract an excessive emphasis on self-interest and to secure not only the maximum of production but also the most equitable distribution.

Knies applied his methodological principles to the study of concrete economic phenomena. Thus his *Geld und Kredit* (2 vols., Berlin 1873-79; 2nd ed. of vol. i, 1885; reprinted Berlin 1931) is still unsurpassed for its masterly treatment of the fundamental problems of money, capital, credit and interest and for its emphasis on the close interrelation of economic and legal institutions. In a supplementary volume, *Welt-*

geld und Weltmünzen (Berlin 1874), he distinguishes between the domestic and international uses of currency and analyzes the concept and legal status of a currency designed for international use. Noteworthy also are his earlier volumes, *Die Eisenbahnen und ihre Wirkungen* (Brunswick 1853), in which he discusses the economic effects and cultural incidence of railroad transportation, and *Der Telegraph als Verkehrsmittel* (Tübingen 1857), which is an exemplary treatment of the system of communication. Knies possessed a complete mastery of statistics, for which he claimed the dignity of an independent discipline in *Die Statistik als selbständige Wissenschaft* (Cassel 1850).

HANS GEHRIG

Consult: Weber, Max, *Gesammelte Aufsätze zur Wissenschaftslehre* (Tübingen 1922) p. 1-145; Gehrig, Hans, *Die Begründung des Prinzips der Sozialreform*, *Sozialwissenschaftliche Studien*, no. ii (Jena 1914) p. 255-68; Schmoller, Gustav, *Zur Literaturgeschichte der Staats- und Sozialwissenschaften* (Leipzig 1888) p. 204-10; Lifschitz, F., *Die historische Schule der Wirtschaftswissenschaft* (Berne 1914) ch. iv.

KNIGHTS OF LABOR. The Noble Order of the Knights of Labor had two apparently irreconcilable aspects. In its program and ideology it embodied many of the older cooperative socialist ideals while at the same time it was permeated with middle class liberalism; it held to a diminishing agrarian radicalism while it tried to adapt itself to the growth of mechanized industry and urbanism. For a time, from 1877 to 1887, the Knights of Labor dominated the American labor movement, aroused the workers to a high pitch of enthusiasm and demonstrated its power in great struggles with employers. Its decline, as sudden as its rise, was due mainly to the conflicting and often vague character of its objectives and to the ascendancy of a craft unionism absorbed in the business problems of its own skilled membership with scant concern for the unskilled or the theory of class solidarity.

In the heat of the second American revolution, before the frontier closed, before business enterprise hardened into a national capitalist system and the mind of laborers into a wage consciousness, while the disposition of the public lands and the natural resources, the determination of the medium of exchange and banking methods, modes of production and levels of distribution, control of agencies of communication and the ownership of transportation, combinations of employers and corresponding rights of employees were still debatable issues, the Knights of

Labor achieved a coast to coast organization and attempted to influence decisions on all such public matters, which they considered bound up with the everyday struggles of labor. The pattern for the total American civilization had not yet been fixed, and they believed that creative action could yet fashion it on dreams of the "good life" for all its inhabitants. It was from the Declaration of Independence with its pronouncements on freedom and the privilege to pursue happiness, enriched by the French Declaration of the Rights of Man and the concept of fraternity, rather than from Marxism or from British trade unionism that they drew their inspiration, although the latter also had some influence.

Uriah S. Stephens, founder of the Knights of Labor in 1869, was trained for the ministry, taught school, traveled extensively, studied history and became a tailor by trade. "Where," he asked, "if not here in this Western World, shall the patriotism and statesmanship be found to preserve the race from destruction? . . . The entire history of the world, in every age and in every country, as unvarying as the laws that govern the universe, demonstrates the fact that the physical, intellectual and moral condition of mankind is governed entirely by the conditions that surround the productive toiler, and marks the progress of a people, or indicates, unerringly, the downfall of a nation. This should be the only criterion of a statesman, the guide of the political economist, and the inspiration of the philanthropist." Terence V. Powderly, leader of the order throughout its active national career from 1879 to 1893, urged upon the United States plans for a rationalized society. According to Powderly, "the failure which really led to the organization of the Knights of Labor was the failure of the trade union to grapple, and satisfactorily deal with the labor question in its broad, far-reaching principle: the right of all to have a say in the affairs of one."

Behind these great ideals was the reality of the emerging labor movement, developing its forms of organization and trying to clarify its objectives. The panic of 1857 and the Civil War had almost completely disrupted the labor movement; it revived after the war and many unions were formed, one of the most important of which was the National Labor Union founded in 1866. This association united a considerable number of local unions with several farmers' societies and mere political groups; it combined middle class radical politics with a more definite labor program covering shorter hours, inclusive unionism

regardless of craft or skill and organization of the Negro. But the National Labor Union was in its decline by 1870.

During the previous year in Philadelphia dissolution of a garment workers' union led nine of the members (Stephens among them) to form a secret labor society, the Noble Order of the Knights of Labor. Its growth was slow, but it received an enormous impetus from the unemployment and mass discontent which prevailed during the hard times following the panic of 1873. In 1877 the order became a factor in the great strikes of the coal miners and railroad workers; its progress thereafter was rapid and it became the leading national labor organization.

For various reasons it is customary to think of the Knights of Labor as a distinctly American phenomenon. Yet its sponsors were not strictly native. While Stephens had a long American ancestry, Powderly was of Irish parentage; and it was J. L. Wright, a clothing cutter born in Ireland, and Frederick Turner, a gold beater born in England, who drew up its ritual and presided over its secrets at its inception. The Englishman injected his Owenite cooperative enthusiasm into the movement and the Irishmen, particularly Powderly, remained zealous for their kind; Powderly's persistent quest for free homesteads on the public domain to be reserved for settlers reflected his loyal concern for the interests of the Irish who were flooding through the seaports. The very name of the order was a symbol of Old World fraternalism, while the signs and passwords of its secret stage were mediaeval in quality. It was said that Stephens' sojourn in Europe had made him a Marxian, and in the 1870's the reverberations of the Paris Commune echoed through the order. Its membership included all the races that made up the proletariat and the tillers of the soil. It had many features in common with Chartism. But the optimism within the order's directorate, the catholicity of its membership—which included lawyers and politicians, preachers and feminists, small business men and farmers, the skilled and the unskilled, Negroes and whites—the public questions it confronted and its ways of trying to meet them were markedly American at the time. Although the order proposed to organize the entire world and did set up branches in France, Italy, Belgium, England, New Zealand, Ireland and Australia, the impulses of its leaders sprang from a New World environment and an intellectual atmosphere dominated by a small town and farming economy.

The industrial masses in the swiftly growing cities, however, took possession finally of the leaders. The proud motto of the order, "an injury to one is the concern of all," met a fierce response in the mood of wageworkers burdened with a common suffering. At the start the order was influenced by ideas of pure and simple craft unionism; but at its first general assembly in 1878, when the organization definitely assumed national scope, the program of inclusive unionism was adopted. Membership in the Knights was direct, not through affiliated independent unions. The membership was drawn mainly from the unskilled, the new specialized workers created by machine industry and those deprived of their trades by rapid technical changes—nearly all groups of workers ignored by the existing unions of craftsmen and subsequently also by the American Federation of Labor.

Although the national leaders were mainly interested in political reform, the mood of the masses favored more aggressive action and strikes were carried on among miners, machinists, railroad shopmen and other workers. They were bitterly opposed by the employers, who developed an "iron clad" contract in which workers were forced to agree not to join the Knights of Labor. Both the employers' and the workers' moods resulted inevitably in strikes. But the order's national officers did not believe in strikes; they favored arbitration and conciliation. Since employers, however, usually rejected arbitration, the order introduced the boycott into labor disputes as a substitute for strikes and it was used persistently and on a large scale. Amid these developments the national leaders pursued no definite policy, except possibly the policy of avoiding action; Powderly sided now with the socialists, now with the moderates and again with the anarchists. Thus the leaders drifted. The tragedy of bewildered officers played an important part in the drama of the order.

By 1886 the Knights of Labor was at the height of its power with a membership of 702,000. Much of the increase in membership was due to the workers' enthusiastic response to the eight-hour movement, in which the order participated, although the leaders were lukewarm; thus Powderly issued instructions against eight-hour strikes and demonstrations on May Day, 1886. At the very height of its power, however, it met two disastrous reverses. One was the defeat of a strike on Jay Gould's southwestern railroad system. The other was the Haymarket killing, which was used by employers and the press to discredit

the order, although the order had no connection with the demonstration in Chicago, where an unknown person threw the bomb among the police. The national officers not only abandoned but denounced Albert Parsons and his comrades, who were hanged for a crime of which they were probably innocent; this attitude alienated the socialists, anarchists and the more radical workers without sparing the order from continued efforts on the part of its enemies to hold it responsible for anarchy and violence.

These reverses gave new strength to factional disputes, which finally resulted in splitting the organization. The most important of these disputes was that between craft unionists and the more numerous advocates of inclusive unionism. The miners of the Pittsburgh region had early rebelled against dictation by the original assembly of garment cutters in Philadelphia, and the difficulties arising from the diverse labor problems in workshop and coalpit forced some adjustments. Other segments of labor advanced jurisdictional claims, and concessions were made. Nevertheless, the Knights of Labor remained a centralized body with respect to authority and leadership; it was an intertrade alliance, whereas the craft unions demanded autonomy. These unions increased their efforts to gain supremacy within the Knights and revise its plan of organization. The struggle was aggravated by the hordes of reformers and radicals which the order had attracted. Political actionists of the Greenback, labor and socialist schools bored from within and attacked the order from without in an effort to commit it to independent political action, arguing that this was the logic of the Knights' important legislative program; anarchists worked under cover of its banner for revolution against capitalism by violence; "traders in votes, seekers for office, spoils hunters, shopkeepers with an eye to business" allied themselves with the order for this object or that; the boycott was used as a weapon in factories and at the polls—with employers, with commodities, with politicians; cooperators encouraged by the society opened plants, made headway, lost ground. Through all the turbulence of opinion and endeavor to checkmate capitalism Powderly and other exponents of the Knights' *raison d'être* maintained that its role was primarily educational, that social principles must be established by its agitation and that this was prevented by wage consciousness with its narrow and precise planks. Weakened by its motley groups of reformers and radicals, the

order was now abandoned by them and its disruption was accelerated by the revival of prosperity. It is true that prosperity collapsed again in 1893, but by that time the Knights of Labor was dead; and the organized labor movement, represented by the American Federation of Labor, had another policy and program.

The craft unions, originally submerged in the order, became an independent national organization. Internal resistance on the part of the craft unions to the order's ideas of inclusive unionism was followed by their secession and the founding of the American Federation of Labor. In addition the masses were disappointed in the practical work of the order and disgruntled with its political aspirations. As long as there was a chance to mold the government by arousing general public opinion, leaders of the Knights threw their energies into the enterprise. But when the issues of the banks and the currency, the public domain and the railways and the telegraphs were settled by Congress in its own way; when invention had proceeded so far that minute specialization in manufacture was accomplished; when the national market was attained; when cities with factories and tenements rose on the western plains; when associations of industrial captains were knit into compact units for their own advantage; when the concentration of the craft unionists on wages, hours and the immediate interests of the crafts appeared to be the more convincing labor movement, the Knights gave place to the American Federation of Labor modeled on the plan of the British Trades Union Congress—a wage conscious organization in a monarchy. "Practical" men took charge of the labor movement.

In this development no doubt personality was an element. Gompers and Powderly could never pull in the same harness, although they did make some effort to do so. For instance, in 1889 a division of activities and spheres was debated with a view to eliminating dual assemblies by giving the federation control over trades and leaving the Knights supreme over popular education. But the compromise was unacceptable to the Knights. In 1889-90 they lost their industrial character and became political, for the moment carrying the reluctant Powderly with them. Finally in 1893 the socialist and agrarian factions under the leadership of Daniel De Leon ousted Powderly from office and assumed the management of the order. De Leon's agrarian allies broke with him, and he thereupon laid plans for a new socialist union organization, the Socialist

Trade and Labor Alliance. The remaining rank and file drifted for the most part into the American Federation. The Noble Order of the Knights of Labor was no more.

Still there are fundamental achievements to be accredited to the Knights. It circulated ideas of enduring vigor. The Knights of Labor's conception of an inclusive unionism embracing all wageworkers regardless of craft or skill influenced the American Railway Union in the early 1890's; the conception reappeared without the middle class radical politics in the industrial unionism of the American Labor Union and its successor, the Industrial Workers of the World. Many of the political reforms urged by the order were subsequently enacted into law. It discussed workmen's compensation; the income tax; factory laws; safety in mines; the weekly payment of wages in lawful money; labor exchanges for the distribution of the unemployed; postal savings; housing; social insurance; proper control of immigration; convict competition with law abiding citizens; the recognition of women in industry and provision for equal pay for equal work; the incorporation of trade unions; legislation fostering the voluntary arbitration of disputes between capital and labor; labor bureaus in the states; a national labor department; adult education by means of libraries, lyceums and study courses; and a general eight-hour day to provide leisure for the improvement of the mind. The order represented a continuous democratic criticism and an effort at economic and political planning which would, it thought, transcend "decisions now made in industry, in the workshops and factories, in the mines and mills, in the commercial establishments, on the railroads and in the counting-rooms."

KNOWLES, LILIAN CHARLOTTE ANNE (Tomn) (1870-1926), English economic historian. Mrs. Knowles received her training as an economic historian at Cambridge under William Cunningham, whom she assisted with the second part of the third edition of his *Growth of English Industry and Commerce* (2 vols., London 1903). In 1904 she began teaching modern economic history at the London School of Economics and Political Science; in 1907 she was given the title of reader in economic history and in 1921 that of professor of economic history in the University of London. From 1920 to 1924 she was dean of the faculty of economics and political science, the first woman dean in the history of the university.

The study of economic history in England owes much to the pioneer work of Mrs. Knowles. When she began to lecture no other English university offered courses on the nineteenth century economic history of any country except England, and even English economic development after 1850 with the exception of labor history received little attention. She had to build up the subject for herself, and her grasp of original sources and power of combining exact detail with vigorous and significant generalization is shown in her books. But her real *métier* was never that of a writer. It was many years before she began to remodel her lecture courses into textbooks and she lived to finish only two volumes, the others being completed by her husband and a pupil after her death. The fruits of her work are to be sought as much in the books of her

students as in her own, and it was as a teacher that she chiefly advanced her subject and made her mark upon generations of students drawn from all parts of the world. She had a personality of remarkable force and vitality, compact of learning, enthusiasm, prejudice and wit, and she was undoubtedly one of the greatest teachers of her time.

KNOWLTON, CHARLES (1800-50), American birth control pioneer. With Robert Dale Owen, Knowlton founded the American birth control movement and influenced American and British social life through the promotion of the institution of voluntary parenthood. Knowlton was a physician and a self-taught freethinker, who came into conflict with the Massachusetts courts for publishing his *Fruits of Philosophy* (New York 1832). Reissued soon afterward in England, the treatise had a limited circulation until it became the center of the prosecution of Charles Bradlaugh and Annie Besant. In 1877 a court decision for the defendants did much to vindicate the legal right to disseminate contraceptive information. The publicity attending the prosecution for publishing Knowlton's book resulted, in subsequent years, in the distribution of several million birth control tracts with a consequent decline in the birth rate. The trial created a market for more effective methods of control and paved the way for specialized clinics under medical supervision.

KNOX, JOHN (1506-72), leader of the Scottish Reformation. As reformer, historian and publicist Knox left a deep impression on the six-

teenth and seventeenth centuries. His intimate association during his early years with the Scottish reformer George Wishart carried him gradually in the direction of Calvinism. Involved in the rebellious movement of protest against Wishart's martyrdom, he was disciplined by the French authorities who controlled his native land. After nineteen months in the galleys he was set free in England, where he preached with distinction as a minister of the Church of England until the accession of Mary in 1554. Years of exile on the continent increased his restless desire to unite Scotland and England in a solid front against the growing Roman Catholic threat of France and Spain, but neither from Calvin in Geneva nor from Bullinger in Zurich was he able to elicit unequivocal advice as to the propriety of rising against the tyranny of Mary Tudor in England and of Marie of Guise, French regent of Scotland. When in 1559 he returned to Scotland, the Reformation there had entered upon a new phase. Based on principles outlined by Knox in epistles forwarded from Dieppe, it was now committed in open repudiation of the prevailing tenets of orthodox Calvinism to a campaign of active resistance against idolatrous rulers in church and state. Under the vehement leadership of Knox Scotland became the crucial salient in the fast culminating struggle between Protestant and Roman Catholic forces in Europe. In answer to Knox' repeated assurances of a revolution in Scottish sentiment in favor of England Lord Cecil sent in July, 1560, an armed body, which drove the French from Scotland. During the remaining ten years of his life Knox devoted himself to inaugurating and consolidating the Calvinistic regime in Scotland; and in his zeal to disseminate the new truths he outlined a comprehensive system of education, which unfortunately was too far in advance of his age.

Throughout his writings, in his tendentious *History of the Reformation* (London 1587) as well as in his occasional pamphlets, Knox is preoccupied almost exclusively with the fortunes of the Calvinistic faith and with the immediate factors determining its progress. Engrossed in blasting idolatry whatever its form, he was not deterred by juristic subtleties from shattering the immunity of kings, which Luther and Calvin had left standing. In his efforts to provide a theoretical justification for his pioneer challenge he formulated, although with no pretensions to a formal system, broader principles of social contract and popular sovereignty. These inci-

dental principles may be interpreted as echoes of familiar mediaeval doctrines which he and Buchanan had absorbed at the feet of their early Catholic teacher, John Major, or possibly as restatements of the principles and procedure outlined by the later Lutherans. Although his writings anticipate more nearly than do the intervening works of the French and Spanish monarchomachs the fully developed rationalism of seventeenth and eighteenth century contract and natural law theories they are essentially occasional and polemic, deriving their importance rather from the accompanying historical movement and from the fact that they constitute with one or two minor exceptions the earliest examples of a type of politico-theological pamphleteering which during the succeeding century blasted in piecemeal fashion the foundations of royal absolutism.

KOCH, ROBERT (1843-1910), German medical scientist. Koch came under the influence of Jakob Henle at the University of Göttingen, where in 1866 he was given his degree. In 1872 he became district physician at Wollstein, supplementing his medical practise by microscopic studies. He first sought the cause of anthrax among cattle and in 1876 made his epoch making demonstration of the complete life history and sporulation of the anthrax bacillus. With full mastery of the new microscopic methods, which he did much to perfect, he then worked out the aetiology of traumatic infectious diseases. In 1880 he was appointed to the Reichsgesundheitsamt (imperial health department), which with the further development of his methods of research by means of plate cultures soon became the leading observatory of contagious diseases in the world. When announcing the discovery of

the tubercle bacillus by special culture and staining techniques in 1882 he set forth the methods of establishing the pathogenic character of a microorganism which have come to be known as "Koch's postulates." In 1883, when he went with his pupils on an official German expedition to study cholera in Egypt and India, he discovered the cholera vibrio and the ways in which it is transmitted; he also found the microorganisms of infectious conjunctivitis. In April, 1885, he became professor of hygiene and bacteriology at the University of Berlin; and in the laboratories of this institution in addition to his ceaseless research in tuberculosis he directed attention to the problems of general hygiene. In 1890 he announced tuberculin as a possible remedy for tuberculosis in its early stages; the claim has not been entirely substantiated, but tuberculin has proved a reliable means of diagnosis. The Institut für Infektionskrankheiten was founded for him in Berlin in 1891 and it remained under his direction until 1904, attracting many of the most famous bacteriologists of the period. Koch assisted in the campaign against cholera in Hamburg, showed how water borne epidemics could be prevented by proper filtration, devised a method of preventive inoculation of rinderpest in South Africa and made significant studies of Texas fever, black water fever, tropical malaria, surra, the plague, leprosy, Rhodesian red water fever, horse sickness, trypanosomiasis and recurrent fever in German East Africa. The methods which he established for the control of typhoid have been widely adopted.

By virtue of his original contributions in the campaign against epidemics and his formulation of methods which enabled others to make important medical discoveries Koch must be considered as one of the greatest public benefactors of all times.

KOGĂLNICEANU, MICHAIL (1817-91), Rumanian statesman, historian and social reformer. Kogălniceanu was born in Moldavia and pursued his studies first at Jassy and later at

Lunéville and at Berlin, where he completed his "Romänische oder wallachische Sprache und Litteratur" in *Magasin für die Literatur des Auslandes*, vol. ii (1837) nos. viii-x, his *Esquisse sur l'histoire, les mœurs et la langue des Tziganes* (Berlin 1837) and his *Histoire de la Dacie, des valaques transdanubiens et de la Valachie, 1241-1792* (Berlin 1837, 2nd ed. 1854). Upon his return to Moldavia in 1838 he plunged with enthusiastic energy into the political arena. Throughout his entire political career Kogălniceanu strove to bring about a fusion of the two autonomous principalities of Moldavia and Wallachia into a united political state. He took an active part in the election of Alexander Cuza as ruling prince of the united principalities and in the coup d'état of 1864, which put an end to Turkish domination.

As head of Cuza's cabinet Kogălniceanu modified the criminal code by abolishing the death penalty and by reducing considerably the life term imprisonment of the criminal. He changed and consolidated the political administration of the country by creating in each regional district a departmental or county council to advise the prefect on all matters pertaining to administration and social reform, by giving each municipality local autonomy to pursue its economic evolution and by secularizing the Greek monasteries and bringing them under the authority of the Rumanian Greek Orthodox church. His electoral law of July 14, 1864, advocating the right to universal manhood suffrage was defeated by the opposition, but he succeeded in passing his agrarian law of August 26, 1864, which extended the franchise to the property holding peasant class, through his efforts newly liberated from servitude, tithes and feudal privileges of the landowning class. By the law of 1864, which made primary public education compulsory, he aimed also at making the vote an intelligent tool in the hands of the peasantry.

Kogălniceanu served as minister of the interior from 1868 to 1871 in Jean Bratianu's cabinet, from 1877 to 1878 as minister of foreign affairs and again as minister of the interior from 1879 to 1880. With paramount diplomatic skill he brought about the parliamentary adoption of the long disputed equality of civil rights of all citizens irrespective of their religious or racial differences and promulgated the law of naturalization, whereby foreigners were enabled to protect their right to private ownership of land and real estate. From 1880 to 1881 he was minister plenipotentiary at Paris, where he was

influential in effecting the recognition by the Great Powers of the kingdom of the united principalities with Charles I of Hohenzollern Sigmaringen as ruler.

Kogălniceanu's influence on Rumanian culture was as important as his political achievements. He was professor of history at the Academia Mihaileana at Jassy, editor of numerous literary and scientific periodicals, founder of the National Theater at Bucharest and of the first Rumanian university, established at Jassy in 1860. His greatest literary contribution is undoubtedly his excellently documented three volumes of *Letopiseșile țării Moldovei* (Chronicles of Moldavia, 3 vols., Jassy 1845-52, 2nd ed. Bucharest 1872-74; abridged translation in French as *Fragments tirés des chroniques moldaves et valaques*, 2 vols., Jassy 1845), in which he traces the intricate political history of Rumania in its close relation to the social, economic and cultural evolution of the country; this work constitutes the first important history of Rumania before the works of Xenopol and Jorga.

KOHLER, JOSEPH (1849-1919), German jurist. Kohler became professor of law at Würzburg in 1878 and in 1888 was appointed to the University of Berlin, where he remained until his death. His versatility was amazing. He left numerous works in almost every branch of the law and was a dilettante in poetry, music and art. As a jurist he concentrated especially upon universal legal history and the philosophy of law but he made considerable contributions in other fields as well. He was a pioneer especially in the law of immaterial rights—the law of patents, copy-right and trademarks.

Kohler sought in his philosophy of law an underlying unity for his highly diverse activity. He was the acknowledged leader of the neo-Hegelian school. Like most members of this school he retained only the evolutionary and pantheistic tendencies of Hegelianism and discarded almost completely the Hegelian dialectic. He did not see in the history of humanity the unfolding of the idea of reason or regard the existent as necessarily right, but he satisfied his own fundamental need for idealism by seeking to

learn from experience the law of universal evolution in human "culture," a term which he used in the German sense of the control of nature by science and art. Thus law can be understood only as part of the whole culture of a people. As a social product which changes from age to age it must be studied with the aid of history and ethnology.

Such a philosophy did not represent so much a system as a justification of a Faustian urge to comprehend all knowledge. Although it was valuable in its time as a reaction, on the one hand, against the metaphysical tendencies of the preceding generation, and, on the other, against the barren historicism of the prevailing historical school neo-Hegelianism was vitiated by the high degree of relativity which its tenets encouraged. It is not always clear to what extent the necessity for conscious effort in the adaptation of institutions is recognized by Kohler, and although he perceived a rational purpose in the universe he often seemed to admit the irrationality of particular phenomena. Thus the positions he actually took toward various juristic problems tended to be eclectic. He was opposed to the fundamental theory of the sociological school in criminal law but he accepted nevertheless a great part of its program of prevention. In the World War he saw the debacle of positivism in international law. Indeed toward the end of his life he was preoccupied with the Spanish natural law theorists of the sixteenth century and the philosophy of scholasticism.

During his lifetime Kohler was regarded by some as the greatest of living jurists while others consider him hardly more than an assiduous compiler of an almost endless series of monographs. In the last analysis his reputation must rest upon his achievements as a legal historian and ethnologist. As a legal historian, however, his work often suffers from his great reliance upon intuition. He is accused by Dahm of having treated six centuries of development in mediaeval Italian statutes as a static period of almost changeless culture. In his work in ethnological jurisprudence, in which he carried on the labor of Post, although he was of course dominated by the concept of unilinear evolution, he has been granted praise by anthropologists for his treatment of kinship terminologies.

KOLLÁR, JAN (1793-1852), Czechoslovakian poet and nationalist. Kollár was born in Slovakia and when still a very young man came under the influence of the Slavic ideas of the Czech national leader, Josef Jungmann. During his studies at the University of Jena he was impassioned partly by the romantic German nationalism, partly by the remains of ancient Slavic settlements in Saxony; later in his gigantic sonnet cycle, *Slávy dcera* (Daughter of Slava, 2 vols., Pest 1824; 2nd ed. 1832), he contrasted pan-Germanism with pan-Slavism. In this work he made an attempt to overcome the wretched condition of the Czechs and Slovaks, who were menaced by the Hapsburgs and Germanization, seeking inspiration in the record of the great geographical extension of the Slavs in the past, the large Slavic population in his own time and the promise of a brilliant Slavic future. In the spirit of Herder he combined enlightened rationalism with historical romanticism and conceived of the nation as an instrument of humanity; moreover he believed that the regeneration of a united Slav nation would inaugurate a new era in the history of mankind. He opposed the lingual separatism of the Slovaks and in his treatise *Über die litterarische Wechselseitigkeit zwischen den verschiedenen Stämmen und Mundarten der slavischen Nation* (Pest 1837, 2nd ed. 1844) he put forward a practical program calling for the absorption of the four leading Slavic tongues, Russian, Polish, Czech and Serbian, into one Slavic language. Kollár's rhetoric exerted a most powerful and lasting influence on the national renaissance of the Czechs and Slovaks, although the high hopes inspired by him were toned down to some extent by the sobering reaction of Palacký and Havlíček.

KOŁŁATAJ, HUGO (Kollontaj) (1750-1812), Polish reformer and publicist. Kołłataj was born in the province of Volhynia and studied theology and philosophy at the University of Cracow and in Rome. Appointed canon of Cracow and member of the Commission for Public Education, he reorganized the antiquated educational system of the University of Cracow. He soon turned his attention to the constitutional problems which

confronted the disintegrating Polish state and became the leading spirit in the work of the Four-Year Sejm (Diet); he is generally regarded as the author of the famous constitution of May 3, 1791. After the fall of Poland Kołłątaj was imprisoned first in Austria and, after a brief interval of freedom, in Russia. On his release he returned to Warsaw, where he spent the remainder of his life.

Although Kołłątaj was a priest he was a free-thinker and a follower of the principles of Rousseau and the French Revolution; he later became an admirer of Napoleon. For Poland, however, he advocated a constitutional monarchy headed by a hereditary dynasty with a bicameral parliamentary system; this he considered as best suited to the needs of a country weakened by an unruly gentry struggling for power. A physiocrat, he nevertheless regarded the activities of the urban population as productive and favored the creation of a large middle class both as a source of financial strength and as a political balance against the power of the nobility. Besides a single land tax he urged the necessity of other tax measures, primarily for the purpose of strengthening the army as the only bulwark against the encroaching powers of neighboring countries.

KOLPING, ADOLPH (1813-65), German social worker. Kolping, who was originally a journeyman shoemaker, studied theology at Munich, the center of the Catholic romantic movement, and later at Bonn. Upon the completion of his studies he decided to try to improve

the unhappy social condition of his former fellow craftsmen. He founded in 1847 the first Catholic social organization, the Katholischer Gesellenverein. This Catholic journeymen's guild soon spread from the Rhineland through all German speaking countries and today has branches in nearly all European and several American countries. Its membership at the present time includes more than one hundred thousand skilled workers between seventeen and twenty-five years of age organized in about 1400 locals. The main purpose of this organization is to regenerate family life by establishing its local branches on the family principle (the priest-president being spiritual father of the community) and by providing journeymen with a family home. The guild introduced an early form of adult education of a technical character and endeavored by cultural, moral and physical instruction to develop energetic self-help. Kolping held that social regeneration of a class must be preceded by the moral regeneration of its members based on love, and he consciously opposed the rising influence of scientific socialism which looks for the regeneration of mankind through a thorough reorganization of economic and social conditions only. In politics Kolping shared the views of his friend Bishop Ketteler and put forward no independent program of his own.

THEODOR BRAUER

Consult: Brauer, Theodor, *Adolf Kolping*, *Klassiker der katholischen Sozialphilosophie*, vol. ii (Freiburg i.Br. 1923); Zimmerman, Karl, "Der Gesellenvater" in *Süddeutsche Monatshefte*, vol. xxvi (1928-29) 170-73; Nattermann, Johannes, *Adolf Kolping als Sozialpädagoge*, *Forschungen zur Geschichte der Philosophie und der Pädagogik*, vol. i, pt. i (Leipzig 1925).

KONARSKI, STANISLAW (1700-73), Polish educational and political reformer. Konarski studied in Rome and Paris and was a disciple of Locke and Montesquieu in theory and of Rollin in the practise of education. He was the first to attempt a reform of the schools of his nation, until then almost wholly under the control of the Jesuits. In his Collegium Nobilium, founded in Warsaw in 1740, he aimed to train future statesmen with full regard to the needs alike of body, mind and spirit. Throughout he employed the scientific method—a novelty of great moment. In the face of bitter opposition he held to his course and finally won over even his foes. It was he more than anyone else who made possible the creation after his death of a national educational commission.

At the same time Konarski addressed himself

to the evils of the Polish constitution. His most important work, *O skutecznym rad sposobie* (On effective counsels) (4 vols., Warsaw 1760-63), contains a withering attack on the institution of the *liberum veto*, which enabled any deputy to bring about a dissolution of the Diet and so paralyze all public business, and an elaborate plan to reform the machinery of state. In this work may be found not a few principles later incorporated in the constitution of May, 1791.

By introducing the French language and literature as a cultural factor in Polish education Konarski paved the way for the spread of rationalism in eastern Europe. As a result he was indicted as a freethinker by fellow Catholics, but he was able to refute the charges.

WILLIAM J. ROSE

KÖPRÜLÜ FAMILY, Turkish statesmen. By their extraordinary intelligence and ability they interrupted for a time the rapid decline of the Ottoman Empire. The first of the Köprülü viziers, Maḥmad (c. 1583-1661), came of a humble family probably of Albanian origin and rose from menial to honorable posts in the sultan's service. He held office as governor of Damascus, Tripoli and Jerusalem successively and in 1656, when both the internal administration and the foreign prestige of Turkey had apparently collapsed, was appointed grand vizier. Maḥmad obtained a free hand in carrying out a policy which he had evidently resolved upon long before. He suppressed rebellion, restored discipline in the civil and military administration and reorganized finances so as to enrich the treasury. Inflexible in purpose, he promptly and liberally rewarded the obedient and efficient while he punished corruption and opposition by instant execution. Within five years there was order in the empire and its reputation abroad had been restored.

Maḥmad's son Āḥmad (1635-76) was twenty-six when he succeeded his father as grand vizier, an office which he held for fifteen years. He had received a thorough training in law and had served as governor of Erzerum and Damascus. More humane than his father, he continued essentially the same policies. In addition he did a great deal to protect the people from the arbitrary exactions and activities of government officials and improved the position of the Christians and the adherents of other tolerated religions. His military and diplomatic achievements

led to a temporary revival of the empire. Defeated in a battle against the Austrians at Szent Gotthard on the Raab, Āḥmad nevertheless concluded a treaty of peace at Vasvár without loss of territory. In 1669 he brought to an end the war with Venice over Crete, which had been going on for twenty-four years, by obtaining possession of the island. He won and lost battles in Poland but finally made an advantageous settlement.

Āḥmad's brother Muṣṭafá (1637-91), an experienced soldier and governor, was appointed to the grand vizierate in 1689. In his short term he regulated taxation, instituted economies, built up the army and revived the navy. He recognized the necessity of lightening the burdens of the Balkan Christian subjects, who were tempted to join the enemies of Turkey, and arranged a fixed poll tax in three grades to replace irregular exactions.

Maḥmad's nephew Hüsayn (d. 1702) became grand vizier in 1697 and in that capacity arranged the Peace of Carlowitz (1699), which resulted unavoidably in serious losses of territory. The new vizier followed the policy of his relatives in improving the financial and military system and in his treatment of the Christians, for whom he remitted the poll tax. He was a patron of learning and the arts and built a number of schools. His five years of control repaired considerably the damages of the prolonged war.

Had the Turkish system permitted it, the Köprülü's as monarchs of incomparably greater capacity might have displaced the house of Osman and reformed and modernized the country with rapidity. Actually for the most part they revived policies which had been successful but which were fundamentally unsuited to the changed times.

KORAES, ADAMANTIOS (1748-1833). Greek educator and national leader. Koraes, the son of a merchant, was born on the island of

Chios but at an early age was taken to Smyrna. He studied in Amsterdam and in Montpellier, where he received his doctorate in medicine. In 1788 he came to Paris, where he lived uninterruptedly until his death. His national consciousness was stimulated by the events of the revolutionary period and he was one of those Greeks who under the influence of the bourgeois revolutionary ideology identified national with bourgeois liberty. His familiarity with the literary achievements of the human mind, systematically cultivated since earliest youth, led him under the influence exercised upon him by the example of the French Enlightenment to the realization that the achievement of Greek national freedom must be preceded by a period of intellectual enlightenment. He also aimed to establish a national cultural continuity between the civilization of ancient Hellas and the Greece of his own day and thus devoted himself to the endeavor to accelerate the intellectual renaissance of his compatriots, who were at that time under Turkish rule. Aided by the financial support of the merchants Zosimades he published a series of modern translations of the ancient classics prefaced with introductions in which he developed his views on education and national regeneration. These works were distributed widely throughout Greece and served as the intellectual basis for the Greek national movement.

Koraes' activity as a national educator is closely bound up with his philological views. Since the appearance of the Phanariot scholarship there was evident in Greece a tendency to replace the popular language developed in the course of a long evolution by an artificial scholarly language approximating ancient Greek. Koraes opposed this archaistic tendency; he did not endorse the popular speech as such but declared himself in favor of refining it. In his polemic against anti-evolutional archaism democratic motives also played a part; this he explicitly acknowledged in maintaining that although the scholars are the legislators of language they are legislators of a "democratic concern" which belongs to all. This view, which gave the struggle over the popular speech the appearance of a social struggle that it retains even today, invests Koraes' vision with special significance and marks him as the forerunner of one of the greatest social movements of the new Greece.

KORKUNOV, NIKOLAY MIKHAYLOVICH (1853-1904), Russian sociologist and jurist. From 1878 to 1899 Korkunov was professor of constitutional law and theory of law at the University of St. Petersburg. Although he has often been associated with the school of Jhering he was in reality an entirely original thinker; his ideas resemble to a considerable degree those of Duguit, whom he preceded by several decades.

Korkunov firmly and ardently opposed the voluntaristic theory of law and the state introduced by juridical individualism. At the same time he affirmed the impossibility of detaching juridical constructions from the sociological and psychological study of the reality of law. His most original conceptions deal with the structure of public power and of the state. Korkunov held that public power is not a will but an objective product of the collective consciousness of dependence on the part of its subjects. The state moreover is not a juridical person but an objective juridical relationship; it is a complex system of relations between the individuals and officials who in common realize the public power, which serves as object of these relations. Law according to this conception is not a command of the public power but precedes and goes beyond it, since it proceeds from the collective consciousness in a more immediate manner than does the public power itself. One of the most fundamental problems of the theory of law and of the state—here Korkunov profits by the ideas of Krause and Lorenz von Stein—is that of the relationship between the state and society, which is governed by its own extrastate law. The state, however, must predominate over society, for its power is more favorable to individual liberty.

In his definition of law Korkunov sought to unite the conceptions of Kant and Jhering. Law for him is a "delimitation of interests." The idea of a limit is inherent in idealistic individualism as is the idea of interest in positivist sociology. This amalgamation was not the strongest of Korkunov's conceptions, since it was inconsistent with his own point of view. In fact in opposing juridical voluntarism and individualism it is difficult to consider law as a negative limit, just as it is not easy after having allocated law and power to the spontaneous collective consciousness forth-

with to have recourse to the idea of interest.

Fundamentally Korkunov's ideas, which he himself characterized as an expression of "subjectivist realism," occupied an independent position in the conflict between idealism and positivism. He applied the principle successfully in his very original theory of power and the state but he failed in applying it in his definition of law.

GEORGES GURVITCH

Important works: *Lektsii po obshchey teorii prava* (St. Petersburg 1886, 8th ed. 1908), tr. by W. G. Hastings as *General Theory of Law* (2nd ed. New York 1922); *Obshchestvennoe znachenie prava* (The social significance of law) (St. Petersburg 1890); *Sravnitelny ocherk gosudarstvennogo prava inostrannykh derzhav* (Comparative constitutional law of foreign states) (St. Petersburg 1890); *Russkoe gosudarstvennoe pravo* (Russian constitutional law), 2 vols. (St. Petersburg 1892-93, 8th ed. 1913); *Ukaz i zakon* (Ukase and statute) (St. Petersburg 1894).

Consult: Hecker, J. F., *Russian Sociology* (New York 1915) p. 257-64.

KOROLENKO, VLADIMIR GALAKTIONOVICH (1853-1921), Russian writer and publicist. During his student years in St. Petersburg and Moscow Korolenko was twice exiled for participation in radical activities; and when in 1881 he refused to take a special oath of allegiance to Alexander III he was sent again into exile, this time for three years in Siberia. He had already been occupying himself with writing, and during his stay in Siberia he wrote *Son Makara*, which on its publication in 1885 (tr. by M. Fell in *Makar's Dream and Other Stories*, New York 1916), when he returned to Russia, made him famous throughout the nation. In 1904 at the death of Mikhaylovsky he became editor in chief of *Russkoe bogatstvo* (Russian fortune), a monthly periodical representing the views of the Populist intelligentsia, and he continued in this position until the magazine was suspended in 1918.

Korolenko was one of the greatest masters of Russian literature in his time but he was a profound humanitarian as well as a literary artist. He called himself "a partisan, defending the rights and dignity of man wherever it is possible to do so with the pen." He wrote many stories and several longer works of fiction but his most effective medium was the short sketch for newspaper or magazine. For decades at times of most acute social crisis in places where events of far reaching significance were taking place the "writer Korolenko" appeared without fail. He was a thoughtful and realistic observer and

in his articles he disclosed and interpreted to the Russian public the "true nature of the event." His power as an artist had a far greater effect in awakening radical sympathies than would have been possible had he expressed himself in purely intellectual terms; and it enabled him to continue his crusade against intolerance and injustice despite a rigid censorship. More specifically, his sketches describing the horrors and exploitation by landlords during the famine of 1891 (*V golodny god*, St. Petersburg 1893), exposing the injustice of a ritual murder accusation against half-Christian tribesmen in north-eastern Russia (*Multanskoye zhertvoprinoshenie*) and protesting against the increasing use of capital punishment after the 1905 revolution (*Bitovoe yavlenie*, St. Petersburg 1910) were of profound significance in shaping a new social consciousness in Russia. A belief in non-violent regeneration and an emphasis on the struggle between the government and society rather than on the class struggle are the important elements in Korolenko's social philosophy. His longest work, *Istoria moego sovremennika* (begun in 1906, complete ed. in 5 vols. Moscow 1922; vol. i and part of vol. ii tr. into German by Rosa Luxemburg as *Die Geschichte meines Zeitgenossen*, 2 vols., 2nd ed. Berlin 1919), presents an invaluable picture of Russian life during the late nineteenth and the early twentieth century and abounds in autobiographical material covering several decades.

VLADIMIR ROSENBERG

Works: A collected edition prepared by Korolenko appeared in 1914 (9 vols., St. Petersburg); a definitive posthumous edition is still in the course of publication (vols. i-v, vii, viii, xv-xx, xxiv, Kharkov and Poltava 1923-29). Individual works have been translated into almost every language. In general the French translations are better than the English.

Korolenko kak chelovek i pisatel* (Korolenko as a human being and writer) (Moscow 1922); Haeusler, Eugen, *Vladimir Korolenko und sein Werk* (Königsberg 1930); Umansky, Dmitry, "Vladimir Korolenko" in *Living Age*, vol. cccxiii (1922) 92-99; Savitch, G., "Vladimir Korolenko" in *La revue*, 3rd ser., vol. xlv (1903) 665-76; Calderon, G. L., "Korolenko" in *Monthly Review*, vol. iv (1901) no. 12, p. 115-28.

KÖRÖSY DE SZÁNTÓ, JÓZSEF (1844-1906), Hungarian statistician. Körösy was the founder and first director of the municipal statistical bureau in Budapest and professor of statistics at the University of Budapest. His field

of interest was vital statistics, with particular emphasis on mortality and morbidity rates. In measuring the rates of mortality from specific diseases he devised the method of relative intensity based on the calculation of the proportion of deaths from particular diseases to the total deaths within the respective age group. Using this method to calculate the rates of mortality from smallpox among vaccinated and non-vaccinated people he definitely established the effectiveness of vaccination, which had been hotly contested by antivaccinationists. He also investigated statistical regularities in the propagation of typhoid fever and tuberculosis and studied the effect of housing on morbidity and mortality. In compiling general mortality tables Kőrösy devised the use of the individual register, which enabled him to keep the identity of individuals under observation from birth to death and thus to construct mortality tables for specific groups of people. He compiled the first birth tables after those of Halley and was the first to study the effect of the age of parents on the fertility of marriage and the vitality of offspring. He helped to formulate an international nomenclature of professions and causes of death and worked toward an international unification of the methods of census taking. With Koch and Ogle he constructed an international index of mortality, still in use, based on age distribution with Sweden as a base. Kőrösy was aware of the logical limitations of statistical investigation; although he believed in the existence of statistical regularities in the universe of social phenomena as early as the 1870's he looked upon them as rules of inconstant probabilities rather than as laws of absolute validity.

THEODORE SZÉL

Important works: *Mittheilungen über individuelle Mortalitäts-Beobachtungen* (Budapest 1876); *Projet d'un recensement du monde* (Paris 1881); *Demologische Beiträge zur Erweiterung der Natalitäts- und Fruchtbarkeitsstatistik, Mortalitäts-Coefficient und Mortalitäts-Index* (Berlin 1892); *Die statistischen Beweise des Impfschutzes* (Budapest 1896); "An Estimate of the Degrees of Legitimate Natality as Derived from a Table of Natality" in Royal Society of London, *Philosophical Transactions*, ser. A., vol. cxxxvi (1895) 781-875.

KOŚCIUSZKO, TADEUSZ ANDRZEI (1746-1817), Polish national leader. Kościuszko, a descendant of Polish-Lithuanian gentry, received his early education at Warsaw and later pur-

sued a course of study at Paris, where he came under the influence of the political and social ideas which culminated in the French Revolution. Impelled by his enthusiasm for liberty he participated as a colonel in the American War of Independence and after his return to Poland attained distinction in the Polish-Russian War of 1792 waged in defense of the constitution of May 3. Two years later, when he was offered the leadership in the insurrection against the encroaching control of Russia in Polish affairs, he assumed the dictatorship and freed the peasantry from personal servitude and in part from statutory labor. The crushing defeat of the Polish army at Maciejowice put an end to Polish independence and with it to Kościuszko's social reforms; he himself was taken prisoner by the Russians. But although his reforms were short lived they had a profound influence upon Polish political thought, and the idea of the emancipation of the peasants has been a part of nearly all subsequent movements for Polish independence.

Set at liberty after the death of Catherine II, Kościuszko went abroad, where he assumed the moral leadership of the Polish émigrés and of the legions fighting in Italy and Germany on the side of republican France against the partitioning powers. He held radical views and was opposed to the consulate and the empire. He refused to participate in the partial reconstruction of his country in the form of the Duchy of Warsaw and demanded from Napoleon the restoration of the historical frontiers of Poland and a liberal constitution; because of this attitude his influence among his countrymen suffered a temporary eclipse. After the downfall of the empire he endeavored to gain the support of European opinion and of the victorious Alexander I for his ideal of an independent Poland; and during the Congress of Vienna, which created the kingdom of Poland, he drew attention to the necessity of improving the lot of Polish peasants. Disappointed in his hopes, he spent the remaining years of his life in retirement in Switzerland. Kościuszko remained the symbol of the Polish aspirations to the status of an independent nation, and the Kościuszko legend has been one of the main forces making for the establishment of national independence and democracy in Poland.

KOSSUTH, LAJOS (1802-94), Hungarian statesman, orator and political writer; chief leader of the Hungarian Revolution of 1848-49. Kossuth through his exceptional oratorical gift, magnetic personality and unique power of organization symbolized more than any other man Magyar nationalism, which was at that time intimately connected with liberalism. He came from the poorer nobility; although of Slovak extraction he embraced wholeheartedly Magyar nationalism, which he, like Karl Marx, considered the only real cultural and liberal force in the country. As the delegate of an absent magnate at the Diet he was the founder of Hungarian journalism, editing for the first time a kind of a parliamentary gazette (*Országgyűlési tudósítások*). Embarrassed by his brilliant agitation the Viennese government put him in prison; but his three years' imprisonment, which he devoted to deep studies of English language and literature, contributed still further to his development. After his liberation he became as editor of the *Pesti hírlap* (1841) the strongest publicistic influence of the nation, arousing the distrust and suspicion of the conservatives, who felt in him the spirit of the revolution. Although the Austrian government was successful in breaking his connection with the paper, his influence grew rapidly as a result of his campaign for the abolition of the entail, the elimination of feudal burdens and complete national independence of Hungary. In 1847 he became a member of the Diet and his discourse on March 3, 1848, demanding a constitution not only in Hungary but also in Austria made him a European figure. So overwhelming was his campaign that the court was obliged to cede. A parliamentary government was granted and Count Batthyány gave Kossuth a portfolio in his cabinet. The Viennese reaction, however, did not take these concessions seriously and fomented a general insurrection of the southern Slavs and the Rumanians, who were exasperated by the chauvinistic attitude of Kossuth. War against the imperial forces became inevitable; Batthyány resigned and Kossuth assumed power as president of the Committee of National Defense and later as governor of the country. His success as an army organizer was remarkable, but after notable victories the situation of the Magyar forces became untenable as a result of the intervention of the czar in favor of the de-

posed emperor, Francis Joseph. Kossuth was obliged to flee and was interned by the Turkish government. Liberated in 1851 he made a brilliant campaign for Hungarian independence in England and America. He lived forty-five years in exile, trying to get French, Italian and later Prussian support against the Hapsburgs. But his efforts remained unsuccessful and after the dualist system had been created by Ferencz Deák in 1867 Kossuth realized that his cause was lost, at least for his lifetime. He continued to regard the *Ausgleich* as an impossible system doomed to collapse and set over against it the idea of a Danube confederation, which he championed as the only constitutional framework capable of guaranteeing real independence to Hungary and the other smaller Danubian nations. Although the influence of Kossuth was crushed in Hungary by a pseudo-parliamentarian system, he remained the idol of the peasantry and his moral force is even now a vital factor.

OSCAR JÁSZI

Works: Iratai (Works), 13 vols. (Budapest 1880-1911), vols. i-iii tr. into German by J. Helfy as *Meine Schriften aus der Emigration*, 3 vols. (Pressburg 1880-82), vol. i tr. by F. Jausz as *Memories of My Exile* (London 1880).

KOSTOMAROV, NIKOLAY IVANOVICH (1817-1885), Ukrainian historian, ethnographer and publicist. Kostomarov studied at the University of Kharkov and became professor at the University of Kiev. Arrested in 1847 as a member of a Ukrainian secret political society, the Brotherhood of St. Cyril and of Methodius, he was imprisoned and exiled to Saratov. Beginning in 1859 he taught at the University of St. Petersburg, where he was much loved by the students; but he resigned this post in 1862 for political reasons and was never allowed to resume his academic career, although the University of Kiev and other institutions invited him to occupy their chairs of history.

Kostomarov divided his interest and work between history, especially the history of the Ukraine and phases of Russian history, and eth-

nography. His influence on ethnographical studies of the Slavic world has been great; he insisted on the scientific importance of ethnography and demanded that the historian himself study the life and the customs of the entire people—not only of the ruling classes. He was hostile to the Muscovite autocracy, which he viewed as a degeneration, due to the influence of the Tartar horde, of the original Slavic forms of life of the Great-Russian people; these forms he believed to be preserved in their purest state in the Ukrainian people. Although he was inclined toward a Slavophile romanticism he had, however, a great influence on the democratic and progressive movement not only in the Ukraine but also in Russia. His political ideal was a federation of the Slav republics with a democratic constitution; for each nation he demanded the right to an independent cultural and political development. As a Ukrainian he was especially interested in the defense of the rights of the Ukrainian tongue and in the cultural development of his people; he may be regarded as the leader in Ukrainian life from 1858 to 1880.

M. HRUŠEVSKY

Works: *Sobranie sochineny*, 21 vols. (St. Petersburg 1903–06), a collection of historical monographs; *Naukovo-publitsistichni i polemichni pisanya* (Scientific-publicistic and polemical writings) (Kiev 1928); *Avtobiografiya*, ed. by V. Kotelnikov (Moscow 1922).

Consult: *Vseukrainska Akademiya Nauk*, Kiev, *Ukraina* (1925) pt. iii, p. 3–87.

KOVÁCS, GÁBOR (1883–1920), Hungarian economist. After serving as *Privatdozent* at the University of Kolozsvár, Kovács became professor at the University of Debreczen and in 1918 was called by the Károlyi government to the University of Budapest. In his writings he followed essentially the classical tradition but attempted to reformulate the orthodox doctrine in the light of new economic problems which have emerged since the formulation of the classical principles. He disagreed with the historico-ethical school because of its inclusion of extra-economic elements in economic theory; and he opposed marginalism, maintaining that it is based predominantly on the psychology of the consumer and neglects the factors on the supply side. The general acceptance of marginalism despite its basic shortcomings he explained on two grounds: first, because it constituted a welcome relief from the vagueness of the historico-ethical approach; and, second, because it provided orthodox economic theory with a new

rallying point in its struggle against the inroads of Marxism. He was the first economist of academic rank to adopt an unprejudiced position in the treatment of socialist doctrine. Of the post-classical economists Kovács was influenced by Marx and Oppenheimer; the former influenced his distribution theory, the latter his population theory. During the World War Kovács advocated a thoroughgoing agrarian reform and, as a preventive measure for the approaching post-war agrarian crisis, the formation of colonization societies.

RUSZTEM VÁMBÉRY

Works: *Az orosz mir-szervezet szocialgazdaságtani értéke* (Socio-economic value of the Russian mir) (Budapest 1904); *A népesedési elmélet újabb fejlődése* (Population theory) (Debreczen 1906); *Társadalmi gazdaságtan* (Social economy) (Budapest 1914); *A közgazdaságtan elemei* (Elements of social economy) (Debreczen 1915, 2nd ed. 1919); *A közgazdaságtan és a világháború* (Social economy and the World War) (Debreczen 1916); *Vér és kenyér* (Blood and bread) (Budapest 1918); *A szocializmus története* (History of modern socialism), ed. by A. Danos (Budapest 1925).

KOVALEVSKY, MAKSIM MAKSIMOVICH (1851–1916), Russian historian, anthropologist and sociologist. Kovalevsky, the son of a prosperous noble, was graduated from the University of Kharkov and completed his training in Paris at the École des Chartes and in England. His early works dealt with the history of late mediæval and early modern administration in France and England, tracing the limitation of administrative discretion under absolutism by the development of law and judicial institutions. In England he became interested in the origin and history of the village community, a subject much discussed then, and eventually in primitive social organization. After 1877 he was professor of foreign public law and institutional history at the University of Moscow. At this time he made several field trips to study at first hand the Caucasian mountain tribes and published a number of works based on the material he gathered. In 1887, after being dismissed from the university for liberal tendencies, he settled in France. In the following twenty years he published a number of books and articles in French and English, some of them lecture courses delivered at various European and American universities (Stockholm, Oxford, Brussels, Chicago, California) and at the École Supérieure Russe des Sciences Sociales de Paris, which he founded in 1901. During his French residence he completed his two most important works—his study of the origin of modern democracy and his

the framing in 1884 and the revision in 1893 of the Swiss federal law for the encouragement of agriculture. His scientific works on agriculture are most important in their special fields.

ERNST LAUR

KRAEPELIN, EMIL (1856-1926), German psychiatrist. Kraepelin, who studied psychology under Wundt and psychiatry under Rinecker and Gudden, became in 1886 professor of psychiatry in Dorpat; from 1891 to 1903 he held a similar position at Heidelberg and until 1922 in Munich, where he founded the institute for psychiatric research to which he devoted himself until his death. To this institute Kraepelin drew leading men of all the special disciplines bearing on psychiatry and psychopathology and thus furthered the progress of these sciences.

Kraepelin's most significant work was on the classification of the functional psychoses, the symptomatic aspects of which had previously been misunderstood and haphazardly classified. As a result it had been entirely impossible to develop the field of psychopathology, to make general prognoses with reference to course and issue of the diseases, to give general lines of direction of treatment and to collect necessary materials for the study of heredity. Especially through his establishment of the categories of manic depressive insanity and dementia praecox, or schizophrenia, Kraepelin provided a firm groundwork from which research could make and has made further fruitful progress, although his classifications are being modified as evidence accumulates. His experimental work was concerned especially with the psychic effects of toxins. In 1896 he founded the series *Psychologische Arbeiten*, which has been continued by his disciples. His early work on the indeterminate sentence gave him rank among criminologists. He was also prominent in the fight against alcohol in Germany.

EUGEN BLEULER

Important works: *Die Abschaffung des Strafrechts* (Göttingen, 1880); *Psychopathologie* (Stuttgart, 4 vols., 1896-1903, 2d ed. with J. L. Ferri, 1903-1904); *Die Verbrechen des Menschen* (Stuttgart, 1909); *Die Verbrechen des Menschen* (Stuttgart, 1909); *Die Verbrechen des Menschen* (Stuttgart, 1909); *Die Verbrechen des Menschen* (Stuttgart, 1909).

Consult: Wirth, W., "Emil Kraepelin zum Gedächtnis" in *Archiv für die gesamte Psychologie*, vol. lviii (1927) i-xxxii.

KRAUS, CHRISTIAN JACOB (1753-1807), German economist. Kraus' intellectual development was decisively influenced by Immanuel

Kant, who was his teacher and later his colleague when after 1781 he served as professor of practical philosophy at the University of Königsberg. His studies embraced philosophy, mathematics, the classical languages, history and politics; it was not until 1790 that he made economic science his chief interest. Kraus had been well grounded in the ideas of the Scottish moralists; he had also made the attempt to connect logically the principle of the categorical imperative with the concepts of sympathy and conscience of the "impartial observer." He discerned the intellectual relationship which existed between the doctrines of Hume, whose essays he translated into German, and Adam Smith's concept of a harmony of interests resting on economic freedom. Out of his admiration for the English constitution, for freedom and for the encouragement of free economic competition arose his efforts for the realization of these ideals in Prussia, which was then governed almost entirely according to the feudal system. Feeble health prevented Kraus from publishing extensively. His writings comprise only a few short treatises advocating the introduction of freedom of industry and the abolition of the guild system; the suppression of monopoly; the abolition of serfdom, of feudal dues and of the privileges of the nobility; the free division, sale and transmission of property; free trade and deliverance from governmental paternalism. He achieved his great success as an academic teacher through his lectures (first published after his death), which were entirely in the spirit of Adam Smith and by means of which he brought hundreds of auditors into contact with the ideas of economic freedom, especially those officials who were later appointed to participate in the execution of the reforms of the ministers Stein and Hardenberg and to make possible the transformation of Prussia from a feudal state to a modern industrial state.

KARL PRIBRAM

Works: *Staatwirtschaft*, ed. by Hans von Auerswald, 5 vols. (Königsberg 1808-11); *Vermischte Schriften*, ed. by Hans von Auerswald and J. F. Herbart, 8 vols. (Königsberg 1808-19).

KRAUS, FRANZ XAVER (1840-1901), German Catholic church historian and archaeologist. Kraus was ordained a priest in his native city, Trier, and from 1878 as professor at Freiburg i. Br. was recognized as the leading authority on Christian archaeology. He early approached in France the liberal Catholicism of Lacordaire and Montalembert and later became in Italy a follower of Rosmini. He distinguished between "religious" and "political" Catholicism (ultramontanism); the latter he claimed had been created by the mediaeval popes, had been supported by the Jesuits and had predominated since the Vatican Council of 1870. From this point of view Kraus wrote his *Lehrbuch der Kirchengeschichte* (4 pts., Trier 1872-75; 4th ed. 1896), his *Dante, sein Leben und sein Werk, sein Verhältnis zur Kunst und zur Politik* (Berlin 1897)—in Dante he found the model for his combatant yet orthodox relationship with the church—and his *Cavour, die Erhebung Italiens im neunzehnten Jahrhundert* (Mainz 1902). As a "religious" Catholic Kraus championed freedom of conscience, an independent, purely scientific theology and a modern national state entirely separate from the church. He condemned the aspirations of the Curia for supremacy and the organization of German Catholics into a political party. In the Kulturkampf he sought unsuccessfully to persuade Bismarck to uphold the interests of a purely religious German Catholicism against ultramontanism. In his "Kirchenpolitische Briefe," which he published under the nom de plume of Spectator in the Munich *Allgemeine Zeitung* from 1895 to 1899, he defined as ultramontane those who place the church above religion, confound the pope with the church, attribute worldly laws to the kingdom of God, extort religious conviction by means of physical power and sacrifice the individual conscience to outside authority. A Krausgesellschaft founded after his death for the purpose of promoting a "reform Catholicism" patterned on his ideas soon lost its importance through the antimodernistic measures of Pius x.

WOLFRAM VON DEN STEINEN

Other important works: *Geschichte der christlichen Kunst*, 2 vols. (Freiburg i. Br. 1896-1908), completed by Joseph Sauer; *Kunst und Alterthum in Elsass-Lothringen*, 4 vols. (Strasbourg 1876-92); *Real-Encyklopädie der christlichen Alterthümer*, 2 vols. (Frei-

burg i. Br. 1882-86); *Essays*, 2 vols. (Berlin 1896-1901). He also edited *Die christlichen Inschriften der Rheinlande*, 2 vols. (Freiburg i. Br. 1890-94).

Consult: Braig, Karl, *Zur Erinnerung an Franz Xaver Kraus* (Freiburg i. Br. 1902); Hauviller, Ernst, *Franz Xaver Kraus* (2nd ed. Munich 1905); Schrörs, Heinrich, in *Badische Biographien*, vol. v (Heidelberg 1906) p. 424-42.

KRAUZ-KELLES, BARON KAZIMIERZ (1872-1906), Polish sociologist. Krauz-Kelles studied in Paris, where after 1896 he lectured at the Collège Libre des Sciences Sociales; later he taught at the Institut des Hautes Études in Brussels. He early attracted attention by a lecture delivered at the Sociological Congress convoked by the Institut International de Sociologie in 1894 ("La psychiatrie et la science des idées," *Annales*, vol. i, 1895, p. 253-303). From that time his works were regularly published in the *Annales* of that institute and in the *Revue internationale de sociologie*.

Krauz-Kelles was one of the most prominent theorists and leaders of the Polish Socialist party and an energetic worker for the ideal of Polish independence. His more important works and essays in this field were subsequently collected under the title *Wybór pism politycznych* (Selected political works, Cracow 1907). In his journalistic work he employed many pen names, usually that of Michal Luśnia. His scientific works and essays were posthumously published in incomplete form in two books: *Materyalizm ekonomiczny* (Economic materialism, Cracow 1908) and *Portrety zmarłych socjologów* (Portraits of deceased sociologists, Warsaw 1900). He was at heart an exponent of the materialistic interpretation of history. His manner of presenting that theory, however, was marked by a specific trend, which justifies the assumption that further development would possibly have led him to adopt an attitude fundamentally different from that of the formal school of historical materialism.

LUDWIK KRZYWICKI

KREITTMAYR, BARON VON, WIGULÄUS XAVERIUS ALOYSIUS (1705-90), Bavarian jurist and statesman. Kreittmayr's fame rests primarily upon his work as lawmaker for the Bavarian state. German legal disunity made clear in Bavaria as in Prussia in the middle of the eighteenth century the desirability of codification. While in Prussia Samuel von Cocceji, primarily a theorist, wished to bring about through codification an

accompanying reform in the spirit of the Enlightenment, Kreittmayr restricted himself to the exposition of the existing Bavarian law.

The result of his work was the adoption in 1751 of the *Codex juris criminalis bavarici* (criminal law and criminal procedure), in 1753 of the *Codex juris judiciarii bavarici* (civil procedure) and in 1765 of the *Codex maximilianeus bavaricus civilis* (civil law, briefly known as *Landrecht*), all of which he drafted. Although scarcely influenced by the spirit of the Enlightenment and of the law of nature and thus including many antiquated provisions Kreittmayr's codes are notable for their great lucidity in the exposition of traditional law, for their originality in the treatment of many individual questions and for their regard for practical requirements. It is especially said in praise of the *Codex judiciarii* that it resulted in an expedition of the course of civil procedure; of the *Landrecht* that it preserved its intrinsic independence in face of the Roman law and displayed an understanding of the indigenous German law which was extraordinary for that time.

The interpretation of these codes was undertaken in Kreittmayr's best known literary work, his *Anmerkungen*, or commentaries, of which those on the *Landrecht* (5 vols., Munich 1757-68) should be especially mentioned for their intrinsic merit. Kreittmayr intended them to be used in legal instruction in the higher schools; for the same purpose he wrote a *Grundriss der gemeinen und bayerischen Privatrechtsgelehrsamkeit* (Munich 1768). Another of his well known works is *Grundriss des allgemeinen deutschen und bayerischen Staatsrechts* (3 vols., Munich 1769-70).

Thus Kreittmayr not only codified Bavarian law in its several branches but subjected the complete private and public law to scientific redaction—an achievement which at that time could be displayed by no other German state.

EUGEN WOHLHAUPTER

Consult: Eisenhart, in *Allgemeine deutsche Biographie*, vol. xvii (Leipzig 1883) p. 102-15, earlier literature there cited; Bechmann, A., *Der kurbayerische Kanzler Alois Freiherr von Kreittmayr* (Munich 1896); Stintzing, R. von, and Landsberg, E., *Geschichte der deutschen Rechtswissenschaft*, 3 vols. (Munich 1880-1910) vol. iii, pt. i, p. 222-27.

KREK, JANEZ (1865-1917), Slovenian popular leader. His stay at the Vienna Augustineum from 1888 to 1892 was the deciding period of his life, for in the Austrian capital he came under the spell of the doctrine of von Vogelsang, the most

significant theorist of Christian Socialism. Returning to Slovenia as professor of theology at the Ljubljana seminary for priests, he set out to improve the economic and social welfare of the sparse, poverty stricken and oppressed Slovenian people. He was instrumental in the founding of workers' professional unions, workers' consumers societies and workers' building cooperatives; he revived commerce by means of producers' cooperatives and especially furthered the organization of all kinds of agricultural cooperation. His ceaseless effort was one of the chief factors which helped to make Slovenia the classic land of cooperation. With equal zeal and basing his activity always on Catholic doctrine he furthered the cultural advance of the Slovenes, combating alcoholism and illiteracy and organizing youth, workers and farmers for purposes of education.

He engaged also in actual political activity in the predominantly Christian Socialist party, which after 1905 called itself Slovenska Ljudska Stranka (Slovenian People's party). In 1897, 1907 and 1911 he was elected to the Vienna Reichsrat; after 1900 he was a member of the Landtag of Carniola. In parliament he was always a vigorous advocate of absolute democracy. In his book *Socijalizem* (Socialism, n.p. 1901) as well as in his parliamentary speeches he came very near to socialistic lines of thought. He expressly declared himself in favor of a war against capitalism, "the system in which free men, created in God's image, become the slaves of material wealth."

Krek, who was well versed in most of the Slavic languages, sought to destroy the narrow, restricting national community of the southern Slovenes. He favored an alliance with the Catholic Croats and also looked to the orthodox Serbians and Bulgarians, all of whom he considered as members of the one Yugoslav nation. His first hopes for a Yugoslav union through and under the scepter of the Hapsburgs were frustrated by the annexation crisis and the Balkan Wars with all their attendant circumstances. During the World War he organized the Südslawische Klub (Southern Slav Club), the union of the Slovenian deputies in the Reichsrat with the Croatian and Serbian members from Dalmatia. He was the author of the famous declaration of this group on May 30, 1917, which put forward as a minimum demand on the ground of constitutional law and in the name of self-determination the union of the three peoples; the formal phrase "under the scepter of the Haps-

burgs" was included merely to avoid persecution under the high treason clause.

HERMANN WENDEL

Works: *Izbrani spisi*, ed. by Ivan Dolenec, 3 vols. (Ljubljana 1923-25).

Consult: Wendel, Hermann, *Aus dem südslawischen Risorgimento* (Gotha 1921).

KREMER, BARON ALFRED VON (1828-89), Austrian statesman and historian. After attending the law course at the University of Vienna Kremer devoted himself to the study of Islamic languages. In 1849-50 he traveled in Syria and Egypt and upon his return to Vienna was for a short time professor of vulgar Arabic at the Polytechnic Institute. In 1859 he was appointed Austrian consul at Cairo, in 1870 consul general at Beirut and in 1876 member of the Egyptian National Debt Commission. He was Austrian minister of commerce in 1880-81. On the basis of his historical studies and his experiences as minister Kremer published his much discussed *Die Nationalitätsidee und der Staat* (Vienna 1885), in which he held that a strong political tradition emphasizing the idea of the state must be maintained as a protective measure in states of mixed nationalities; this work was directed especially against the Slavizing and clerical trend in Austrian internal policy.

Kremer was one of the pioneers in the field of Islamic studies and without his invaluable works a realistic, popularized knowledge of Islam would undoubtedly not have been available until much later. His brilliant knowledge of Arabic enabled him to edit Arabic texts and his original writings, which deal for the most part with geography and cultural history, reflect his studies in source material. He was also especially interested in the financial conditions of the Arabs. In his *Geschichte der herrschenden Ideen des Islams* (Leipzig 1868) he traced the development of what he believed to be the leading ideas in Islam: the operative concept of God and the original views of the prophecy in the religious field and also the idea of the state which so deeply influenced political life. This book was the precursor of his *Culturgeschichtliche Streifzüge auf dem Gebiete des Islams* (Leipzig 1873), which in turn forecast his still unrivaled masterpiece, *Culturgeschichte des Orients unter den Chalifen* (2 vols., Vienna 1875-77; tr. by S. Khuda Bukhsh, Calcutta 1920), a synthetic work which fully utilized his intensive reading and research. Here Kremer described not only the habits, customs and mode of thought of the Arabs and their in-

tellectual and material achievements but also the rise and fall of the political organism. Despite its inaccuracies it remains a unique study in its field. The papers which Kremer subsequently issued in the publications of the Vienna Academy of Sciences, of which he became a member in 1876, were intended to develop and extend certain aspects of his fundamental work.

FRANZ BABINGER

Important works: "Beiträge zur Geographie des nördlichen Syriens" in *Kaiserliche Akademie der Wissenschaften*, Vienna, Philosophisch-historische Classe, *Denkschriften*, vol. iii (1852) pt. ii, p. 21-45; *Mittelsyrien und Damascus* (Vienna 1853); "Topographie von Damascus" in *Kaiserliche Akademie der Wissenschaften*, Vienna, Philosophisch-historische Classe, *Denkschriften*, vol. v (1854) pt. ii, and vol. vi (1855) pt. ii; *Aegypten*, 2 vols. (Leipzig 1863); "Studien zur vergleichenden Culturgeschichte" in *Kaiserliche Akademie der Wissenschaften*, Vienna, Philosophisch-historische Classe, *Sitzungsberichte*, vol. cxx (1890) pts. i and viii.

Consult: *Kaiserliche Akademie der Wissenschaften*, Vienna, *Almanach*, vol. xl (1890) 183-88; Pfannmüller, D. G., *Handbuch der Islam-Literatur* (Berlin 1923) p. 38-39, 68, 130, 255-56, 266-69.

KREUGER, IVAR (1880-1932), Swedish financier. After concluding his academic studies Kreuger left Sweden in 1900 and passed the following seven years in the United States, Mexico, South Africa and other countries, where he engaged primarily in engineering. He returned to Sweden in 1907 and founded the construction company of Kreuger and Toll. In 1913 he promoted a combination of Swedish match factories in opposition to another and earlier combination, and four years later he united both in the Swedish Match Company. Within ten years Kreuger had expanded this organization into an international trust, with factories in forty-three countries and control over approximately 80 percent of the world's match supply. The trust consisted of a series of holding companies culminating in the Kreuger and Toll Company, which was converted into a holding and finance company under Kreuger's personal control.

Kreuger was a man of extraordinary organizing and administrative ability. His work resulted in the practical elimination of the competitive struggle in the match industry, first in Sweden and then in the international sphere. In the course of consolidating the world trust he began in 1925 to extend loans to governments (securing the necessary capital mainly in the United States and England) in return for concessions of the public match monopoly—a development

based upon the strained and necessitous character of post-war government finances. In this way he acted as intermediary between countries rich and poor in capital and extended loans of over \$360,000,000 to Poland, Greece, France, Hungary, Yugoslavia, Latvia, Rumania, Germany, Estonia, Turkey, Lithuania, Danzig, Ecuador, Bolivia and Guatemala, mainly to strengthen the match trust but sometimes for other industrial and financial purposes. Thus he constructed a concern of a peculiar type, which has justly been called an economic state, since it negotiated with states as one with equal rights. Although the world match trust was industrially limited in scope—it never employed more than 60,000 workers—Kreuger erected upon its base an extraordinarily intricate and powerful financial structure, which included interests in banks, real estate, timber, pulp, mining, cement and other enterprises many of which had no direct connection with the production and distribution of matches.

At the height of his power Kreuger enjoyed nearly unlimited confidence and credit among financiers impressed by his talents, persuasive manner and "obvious honesty." He was not only considered the most successful and capable of leaders but the creator of a new phase of the capitalistic system. Consequently the disillusionment was all the greater when after his suicide, the result of financial troubles, it came to light that for many years he had falsified accounts, borrowed on the security of fictitious match concessions, forged Italian government bonds, pledged German government bonds twice over as collateral for loans and in general systematically deceived his associates. These manipulations were enveloped in an almost impenetrable secrecy by the complicated array of companies, some of them fictitious, which he organized through the holding company device. As the unusually speculative character of post-war European and American finance had facilitated Kreuger's manipulations, so the financial crisis of 1930-31 strained the resources of an already weakened organization and precipitated its collapse.

KRIŽANIĆ, JURIJ (1617-83), Croatian theologian and political writer. Križanić was one of the first to recognize the feasibility of fusing all Slavs into a single powerful nation based on community of ideas and interests. He looked to Russia as the only Slav power capable of securing to the Slavs an independent and honorable place in the family of great nations. He believed, however, that a cultural and spiritual union must precede political combination. With that in view he attempted to effect a reconciliation between the Russian and the Roman churches in order to remove the most powerful obstacle in the way of political cooperation between the two divisions of the Slav race. After spending many years in Rome he came to Moscow to appeal to the Slav consciousness of the Russians. His mission, however, failed; he was met with suspicion bordering on hostility and exiled to Tobolsk. Križanić's ideas were in advance of his times, for in the seventeenth century religion and nationality were still conceived as inseparable. In Moscow he aroused suspicion because he lent the national idea a religious color; in Rome he did not receive favorable attention because his religious ideal was tinged with nationalistic tendencies. Križanić was a political writer of note. His *Politica* (published as *Russkoe gosudarstvo vo vtoroy polovine XVII veka*, Moscow 1860) contains in addition to illuminating and objective observations on the life of Muscovy in the seventeenth century one of the first formulations of the theory of enlightened absolutism: the sovereign is responsible not only to God but to public opinion as well, and his rule must conform to the fundamental laws of the country. Križanić's economic views were those of contemporary mercantilism. He stressed the positive role of the state in developing the productive forces of the nation and urged state control of foreign trade. He departed from the mercantilists in emphasizing the importance of agriculture, thus anticipating the doctrine of the physiocrats.

E. ŠMURLO

Consult: Jagić, V., *Život i rad Jurja Križanića* (Life and work of J. Križanić) (Zagreb 1917); Valdenberg, V. E.,

Gosudarstvenniya idei Krizhanicha (Political theories of Križanič) (St. Petersburg 1912); Šmurlo, E., "From Križanič to the Slavophiles" in *Slavonic Review*, vol. vi (1927-28) 321-35, and Jurij Križanič (1618-1683): *Panславista o misionario*, tr. from Russian ms. by E. Lo Gatto (Rome 1926), and *Le Saint-Siège et l'Orient orthodoxe russe (1609-1654)* (Prague 1928).

KROCHMAL, NACHMAN (1785-1840), leader in the movement of the Jewish *haskalah* (enlightenment) and one of the founders of modern Jewish scholarship. Born in Galicia and brought up in the orthodox Jewish tradition, he nevertheless acquired a deep and extensive knowledge of ancient and modern languages, natural and moral sciences and metaphysics. He steeped himself in mediaeval Jewish religious philosophy and in western philosophy from the period of Spinoza to the close of German idealism, with special interest in the philosophy of history. His doctrines were transmitted largely by oral tradition among a host of disciples and not until his last years did he commit his life's work to writing in his *More nevuchei ha-zeman* (Guide to the perplexed of our age), which was first published by Zunz in 1851. Krochmal's starting point was the problem of faith and knowledge, particularly as it concerned Judaism. Religion and philosophy were to him identical, and the God of Jewish monotheism coincided with the mediaeval Aristotelian *causa prima*. In the philosophy of history, where his thought attained its greatest maturity, he distinguished four principles: the impulse to sociability as a formative element of society and state, the idea of natural development, the spirit and the absolute spirit. He accepted the idea of a *Volksgeist*, or spirit of a people, which was derived from Montesquieu; and he held that the individual mind was the product of human society, which expressed this *Volksgeist*. The absolute spirit, on the other hand, was the creator of all history. In his treatment of Jewish history he analyzed the process of development through the scheme of three stages occasionally employed by earlier historians: youth, maturity and decline. He believed, however, that Judaism, as a result of its alliance with the absolute spirit was at present enjoying a new youth after having passed through its stage of decline.

Krochmal, the first secular Jewish historian, is especially noteworthy for his historical understanding and for his ability to relive the periods of the past. He employed his genetical critical method in a masterly fashion as a critic of the

Bible, the *halacha* and the *aggada*. Besides his great influence in these fields of scholarship he affected the thought of various Jewish poets and thinkers in Galicia and Russia.

S. RAWIDOWICZ

Works: *Kitbe Rabbi Nachman Krochmal*, in Hebrew, ed. by S. Rawidowicz (Berlin 1924).

KRONVALDS, ATTIS (1837-75), Lettish publicist, educator and nationalist leader. Kronvalds came of a peasant family and studied in Berlin, where he followed the German national movement and studied carefully the conditions of the German peasant class. On his return to Latvia he became active in the young Lettish national movement, which directed its efforts primarily against the supremacy of the privileged Baltic Germans who were allied with the landed aristocracy and the clergy. The movement found its chief support among academicians, teachers, farmers and tradesmen, who organized newspapers, schools and various nationalist societies; of these the most important was the Lettish Society of Riga established in 1868. In 1869 they founded the newspaper called *Baltijas vēstnesis* (Baltic courier). Through his writings in nationalist publications Kronvalds aroused the Letts to an appreciation of the need for national education and a revival of national consciousness, urging the establishment of Lettish high schools and demanding that the Lettish language be taught in all schools. His most important work, *Nationale Bestrebungen* (Dorpat 1872), which discussed all these questions, obtained a wide circulation and placed him among the leaders of the Lettish national renaissance.

M. VALTERS

Consult: Kundsinsch, K., *Kronvalds Attis* (Riga 1905); Blanks, Ernst, *Latviešu tautas atmoda* (Riga 1927) p. 127-40; Walters (Valters), M. *Letiland* (Rome 1923).

KROPOTKIN, PRINCE PETR ALEXEYEVICH (1842-1921), Russian scientist, sociologist and anarchist. As an official in Siberia in 1862 Kropotkin made important geographical and anthropological investigations, which led him to conclude that state action was ineffective

while mutual aid was of great importance in the struggle for existence. He thus affirmed solidarity as a factor of progressive evolution in contradiction to the Hobbesian thesis of eminent Darwinists, and opposed to the historians' theory of the constructive value of legal compulsion and state power the idea that the work of ignorant masses through spontaneous cooperation was chiefly responsible for production, construction and progress. From these beginnings he went on to develop his theory of anarchist federalism, which in 1872 brought him into the First International in Switzerland; with the split in that organization he went with the Bakuninist Jura Federation against the Marxist current.

Imprisoned in Russia in 1874 for revolutionary propaganda, he escaped to western Europe in 1876 and thereafter devoted himself to writing on natural sciences and to propaganda which he contributed to various anarchist journals. His writings, translated into many languages, were a main source of the ideology of the anarchist-communist movement. Expelled from Switzerland in 1881, he went to France, where he was imprisoned in 1883 and served a three-year term. After 1886 he lived chiefly in London. He urged French anarchists not to oppose the extension of the military service period, on the grounds that France must defend democracy against German imperialism; and he championed the Allied cause during the World War. He returned to Russia after the February revolution, supported Kerensky and urged a renewed military offensive. After the Bolshevik revolution because of his opposition to proletarian dictatorship he devoted himself only to writing.

Kropotkin sought a scientific foundation for anarchist theory. Modern science, he argued, recognizes in final results the cooperation of the minutest individualities and substitutes for the metaphysical concept of law that of spontaneous equilibrium varying with the variation of factors. To explain historical facts and to solve problems in the social sciences it is necessary to see masses as composed of anonymous individuals and to study the life, conditions and needs of the latter. Prejudice in favor of law, which education fosters, breaks down when we recognize that law is not intrinsic but that society was originally governed by custom and spontaneous solidarity. Law arises when the oppressing tendency triumphs through violence and superstition. Adroitly confusing spontaneously respected moral norms with the sanctification of inequalities law protects privileged usurpers rather than

the rights and liberty of all; the latter are respected only to such degree as the populace can compel respect. Law and the state correspond to a regime of economic exploitation; a regime of equality is incompatible with any government, even delegates and representatives being subject to laws and domination. Capitalism cannot achieve that universal well being which the progressive technical power of production should, despite Malthus, insure. Aiming only at private gain capitalism measures production not by the needs but by the acquisitive capacity of the population.

Kropotkin disapproved of Tolstoyan non-resistance and asceticism as well as of the individualist anarchism of Stirner. Instead of the class struggle Kropotkin urged going "to the people." Revolution should abolish private property and the state. Having destroyed society it should rebuild on the basis of autonomous groups and federations from the simple to the complex, following the tendency already dominant in every field of life and production. All persons, including intellectuals, from twenty to forty-five years old are to perform manual labor, which will become pleasing and voluntary because unrestrained initiative and invention will suppress repugnant and unwholesome work and enable four to five hours daily labor to assure universal bountiful well being. For the principle of wages Kropotkin wished to substitute the principle of needs, of the right to existence and well being for all who cooperate in producing. Each will be the judge of his own needs; the obligation to work will be absolutely spontaneous, not forced.

While his system is often ingenious, Kropotkin leaves many philosophical and practical questions unanswered and frequently contradicts himself. Characterizing courts and prisons as "universities of crime" he held that criminals must be cared for as unfortunates; on the other hand, the rebellious and the drones are to be expelled from the group. Kropotkin never explained how the rise of the oppressive tendency, which along with cooperation he saw as the offspring of social life, could be avoided in an anarchist regime; how the multitude, which, he held, has no clear program and consequently tends to follow a party of action and to be governed by it, could avoid this fate under anarchism; how everything would be organized without organs of government; how communal, regional, national and international groups and federations of production and consumption

would function without delegated and representative authority. The incompleteness of the anarchist program became especially clear after the fall of the czar, when Kropotkin had no plan for "the people" to follow except that of supporting the Kerensky government. The nobility of Kropotkin's inspiration, his honesty in discussion and the sincerity of his conviction evidenced by his whole life are, however, beyond question.

KRUEGER, PAUL (1840-1926), German jurist. Krueger was a pupil of Keller, the celebrated Romanist and proceduralist, and later became one of the closest collaborators of Theodor Mommsen. He participated in the preparation of Mommsen's great critical edition of the *Corpus juris*, editing the Institutes and the *Codex*. He also collaborated on Mommsen's edition of the Digest and after the latter's death superintended the later impressions; in this work he distinguished himself by evaluating the new interpolation research at its true worth.

Krueger's special field of work was the writings of the jurists. His edition of Gaius, which he prepared in collaboration with the philologist Studemund in 1877, remained the best until 1925, when it was surpassed in part by the edition of Kübler. This background admirably fitted him to write the *Geschichte der Quellen und Literatur des römischen Rechts* (Leipsic 1888, 2nd rev. ed. 1912). Like all his writings it is rather a literary historical survey than an actual history of problems. The problem of interpola-

tion was at that time still unrecognized and thus received no consideration.

His critical edition of the *Codex theodosianus* was pursued by a strange misfortune. After working on it for twenty years, Krueger had almost completed it in 1898; Mommsen persuaded him, however, to transfer his material to the larger work. Krueger undertook another edition of his own in 1923 but it was never completed. Although it does not entirely reach the level of his other work it surpasses Mommsen's edition in many ways.

(Leipsic 1924-29) vol. ii, p. 153-69; Stintzing, R. von, and Landsberg, E., *Geschichte der deutschen Rechtswissenschaft*, 3 vols. (Munich 1880-1910) vol. iii, pt. ii, p. 880-82, and notes p. 369-70; Schulz, Fritz, "Paul Krueger" in *Zeitschrift der Savigny-Stiftung für Rechtsgeschichte, Romanistische Abteilung*, vol. xlvii (1927) ix-xxxix.

KRUGER, STEPHANUS JOHANNES PAULUS (1825-1904), South African statesman. As a boy Kruger participated in the great trek from Cape Colony—a movement to escape the Anglicization and the native and land policies of British rule—which resulted in the establishment of the Boer republics. In the course of the turbulent history of the early Transvaal he gained recognition as a natural leader of his people, personifying their characteristics of dogged determination, impatience of restraint and devotion to the ideal of a wide, free land. His successful resistance to the British annexation of the Transvaal from 1877 to 1881 led to his election as president of the republic and crystallized his policy. He held that unless South Africa could be united as a Boer nation the Transvaal must be developed on distinctive lines, separated from the British colonies politically and economically and with its social structure based on the traditions of the pioneers of the trek. The doom of this policy was sealed in 1886 by the discovery of gold on the Witwatersrand, which brought into the republic an *uitlander* population, mainly British, outnumbering the Boer burghers. Kruger vigorously resisted the swamping of his state by the alien element. The result, the South African War of 1899 to 1902, marked his failure, but his ideal of South African nationalism survived and has done much to inspire the present day Nationalist party, which, although its leaders have disavowed the republicanism of its earlier years, emphasizes the

political and cultural distinctiveness of the Dutch South African.

KRUMBACHER, KARL (1856-1909), German Byzantologist. Krumbacher was early attracted to the study of Byzantine civilization by his interest in the phil-Hellenic movement. He studied at Munich and Leipsic and was professor at the University of Munich from 1891 until his death. Although Du Cange had laid the foundations of Byzantine studies in the seventeenth century, it was Krumbacher who revived the interest in this field and created in Europe a center for their advancement. His *Geschichte der byzantinischen Literatur* (Munich 1891, 2nd ed. Munich 1897), an encyclopaedia of Byzantine culture, opened a new world of research by showing that Byzantine civilization was related not only to classical antiquity but also to the mediaeval East and West as well as to the vast Slavic world. In 1892 Krumbacher founded the *Byzantinische Zeitschrift*, the first special organ devoted to Byzantine studies. This periodical, which published articles in all European languages, treated not only political and ecclesiastical history but also various social, economic and intellectual problems. The section devoted to critical bibliography was particularly well presented. Krumbacher was also influential as a teacher; his seminar on mediaeval and modern Greek at the University of Munich attracted students from all over the world.

KRUPP, ALFRED (1812-87), German industrialist. Krupp inherited from his father a small ironworks in Essen, which he developed into the largest metallurgical enterprise in Germany. Although he improved the quality of cast steel to a point where it was superior to the English product, the growth of the Krupp works was exceedingly slow for over twenty years. The Zollverein stimulated industry and commerce in Germany,

especially the building of railroads; Krupp developed improved rails, which brought him considerable business, and for a time railroad material was the main produce of his plant. Krupp early began to manufacture cast steel cannon, but it was not until 1857 that large orders for the new cannon were secured from Prussia and a few foreign countries. He secured a practical monopoly of ordnance supply for the Prussian army, both through the superiority of his product and by the use of personal and political influence. For a time he used inferior material in his cannon while maintaining the same prices; but when some of the cannon split during firing and the Prussian government threatened to withdraw its orders, Krupp used his personal and political connections to maintain his monopoly, now his most profitable business. He developed a new, much improved field artillery. The Krupp artillery was an important factor in the Prussian defeat of France in 1870. After the war Krupp exploited the danger of an invasion by several of the powers to maintain a large demand for ordnance, a policy continued by his successors; the growth of the German army greatly increased Krupp's business, while the fame of Krupp ordnance resulted in many orders by foreign governments.

In addition to ordnance the Krupp works had an extremely diversified output of metal products. The works grew to vast size, constituting an integrated enterprise which utilized principles of both vertical and horizontal combination; this development was accelerated by the enormous industrial expansion of Germany after 1870. Unsatisfactory experiences with his supply of raw materials led Krupp to acquire direct ownership of coal and iron mines; he had a large interest in Spanish iron mines and developed his own fleet of steamers to import the ore. Primarily a technician and industrialist, Krupp underestimated the importance of financial connections; he believed in the self-financing of industry and fought control by the banks. The crisis of 1874 so strained his credit that he almost lost control of his works to the banks, which he opposed; he was compelled to borrow money on oppressive terms—30,000,000 marks at 90 with repayment at 110 and with interest at 5 percent. His situation was, however, relieved by large foreign orders for ordnance and by orders for rails from the United States, where the railroad boom had revived. After Krupp's death the works continued to expand and to dominate the German iron and steel industry.

Krupp was an opponent of both liberalism and socialism. He considered socialism the great enemy and repeatedly warned his workers against agitators. An authoritarian insistent on being "master of his own house," he ruthlessly opposed trade unions and ordered strikes suppressed under all circumstances. "We want only loyal workers," he said, "who are grateful in soul and body that we offer them bread." He created elaborate benefit institutions, including company houses, for a small group of trusted workers, who enjoyed almost the status of officials.

Dickes (New York 1930); Raphael, Gaston, *Krupp et Thyssen* (Paris 1925); Krupp'sche Gusstahlfabrik, *Zum 100jähigen Bestehen der Firma Krupp* (Jena 1912), English translation (Essen 1912); Murray, H. R., *Krupp's and the International Armaments Ring* (London 1915).

KRUTTSCHNITT, JULIUS (1854-1925), American railroad executive. Kruttschnitt graduated from Washington and Lee University in 1873 with the degree of civil engineer; during the following five years he taught mathematics and in 1878 entered railroad service. By 1895 he had become general manager of the Southern Pacific lines. In 1901, when the Union Pacific Railroad acquired the Southern Pacific, Kruttschnitt became assistant to E. H. Harriman; he was in effect in executive charge of the Southern Pacific and was the mainstay of Harriman's constructive plans. In 1904 he was made director of maintenance and operation of all the Harriman lines and in 1913, when the Union Pacific relinquished control of the Southern Pacific, he became executive head of the latter. In 1917 he served as a member of the Railroads' War Board.

Kruttschnitt was an outstanding builder and administrator of railroad properties, one of the few engineers to rise to high executive position. He took an active part in the rebuilding of two major systems and acquired a well deserved reputation because of the high standard of maintenance and the low cost of operation of the properties under his direction. He contributed greatly to the development of operating statistics, fuel economy and accident prevention. Such was his success in promoting safety of operation that during a period of eight years, within which the Southern Pacific carried 320,000,000 passengers, only one passenger lost his life in a train accident. He recognized the importance of cultivating public opinion, appeared

frequently before Congressional committees and the Interstate Commerce Commission and made many addresses and wrote many articles dealing with railroad problems. He was an earnest advocate of private operation and often protested against the invasion by the government of the field of management, although he had an advanced concept of the public responsibility of the railroads which demonstrated his ability to adapt his views to changing conditions.

KU KLUX KLAN. The original Ku Klux Klan was a secret organization which flourished in the southern states of America in the days of the reconstruction after the Civil War, particularly in the period from 1867 to 1870. Its purpose was to protest against the conquering attitude which the administration was taking in its dealings with the South. The white population was impoverished by the war, the Negro population while technically freed was guided by leaders, largely political appointees, from the North (carpetbaggers) and their southern assistants (scalawags), and the readjustment of the two groups to the new situation created by the conflict made for a welter of loosened passions which pushed both sides into all manner of lawless and vindictive actions. The evidence seems to indicate that the aggressors were the northern politicians, who used the Negroes, organized into secret organizations such as the Union League, to terrorize the southern whites into submission to the politicians' exploitation of political power. The behavior of Negro politicians and rowdies was considered not only a political and economic danger but also an offense against southern ideals of racial purity and social superiority. The atmosphere was rife for some sort of guerilla protest. It came about through the utilization of a harmless social club organized in Pulaski, Tennessee, by a group of young confederate officers. Finding time hanging heavy on their hands, they organized in 1866 a secret society which they called by the Greek name "Kuklos," the circle. The transition from Kuklos to Ku Klux Klan was easy enough, and the power of intimidation which lies in mystery, particularly in dealings with ignorant and superstitious folk, was readily apparent. The Ku Klux Klan was not the only organization of its kind but it has managed to attract the greatest attention. Of other similar

organizations the Knights of the White Camelia was the largest. During its most flourishing period the Klan is said to have had a membership of around 550,000, which would include nearly the entire adult male white population of the South. It was effective in terrorizing the Negro into retreating to his former state of political subservience to the white man or at any rate into giving up most of his political activities. Klan terrorism against carpetbagger and scalawag resulted in a Congressional investigation, which ultimately brought a moderation of previous political methods and a realization of the unwisdom of continuing to treat the South as a conquered territory. It was fortunate that affairs took this turn because the Klan like all secret organizations was beginning to be dominated by the more irresponsible members of the community, who used the motives and the disguise and the mystery of the organization to wreak private vengeance or serve private purposes. After 1872 it was no longer necessary for the white man to don a disguise in order to fight for white supremacy and the Klan disappeared, leaving in its stead a number of organizations, such as the White League of Louisiana, which were able to accomplish their purpose without resort to secrecy. The original Ku Klux Klan was not only influential in the political and social life of the South, but it has added to southern folklore one of its most picturesque and colorful chapters.

The modern Ku Klux Klan has very little in common with the original Klan except the name. The problems which faced the men of the reconstruction period were not present for the founders and adherents of the group which created such a sensation in the years from 1920 to 1925. The psychological motivation behind the new movement will always remain a more or less puzzling phenomenon. It was originated in Atlanta, Georgia, in 1915, by William J. Simmons, but it was of slight importance until 1920, when Simmons associated with himself two professional publicity agents, Edward Young Clarke and Mrs. Elizabeth Tyler. The ranks of the organization soon began to show the effect of this campaign of promotion. The professed motives for its activities varied with the region in which it operated. In the south the Klan appealed primarily to the fundamentalist beliefs in morals and religion; in the north it took on more of an anti-alien and anti-Bolshevik character. Its tactics at first consisted in meeting under the blaze of a fiery cross in the open country, where

its members, masked and hooded in white robes in the traditional Ku Klux manner, listened to fiery addresses of a high moral or patriotic character. Soon after there appeared the other Klan tactics: anonymous threats and occasionally whipping, tarring and feathering and other acts of violence including killing. The *New York World* tabulated the violent actions occurring from October, 1920, to October, 1921, as follows: "four killings, one mutilation, one branding with acid, forty-one floggings, twenty-seven tar and feather parties, five kidnappings, forty-three persons warned to leave town or otherwise threatened, fourteen communities threatened by warning posters, and sixteen parades by masked men with warning placards."

Although these acts of violence were comparatively unimportant the effect was to spread considerable dread and consternation throughout the land, particularly in the south. The secrecy and mystery surrounding the Klan gave it an appearance of great power and enabled it to make a bid for political control. Some leading politicians courted it and the Klan began to play a very important role in the politics of several southern states. On September 6, 1921, however, the *New York World* began the publication of a series of twenty-one articles in which it gave an account of the origin, organization and activities of the Klan, emphasizing particularly its money making aspects. On September 18 the *World* carried a story concerning moral turpitude of both Clarke and Mrs. Tyler which its correspondent had unearthed in the records of the police court in Atlanta as far back as October 31, 1919. On November 11, 1921, Congress began a preliminary examination into the activities of the Klan which brought out much more information concerning its financial activities. The total effect of all of these disclosures and investigations was to cause a break in the ranks of the Klan, leading inevitably to a reorganization of its management. Control passed from Simmons, Clarke and Tyler to a new group headed by Hiram Wesley Evans, a dentist from Dallas, Texas, who was made Imperial Wizard, or chief officer.

The Simmons period was characterized by the aftermath of the war hysteria and by the uneasiness which followed the emotional tension of that struggle, and which was accentuated by the economic distress consequent upon the demobilization and the panic of 1920. With so many irritating provocations it was easy for sections dominated by "fundamentalist" moral and

religious attitudes, like the south and portions of the middle west, to seize upon the explanation given by the Klan as to the source of the evil: personal deviations from the moral code or the machinations of Catholics and aliens. The remedy was as simple as the cause: admonition and punishment of the offender. Around this fundamentalist nucleus there gathered other compulsions: personal animosities; distrust of the efficiency of the instruments of law and order; the scapegoat attitude toward the Catholics where the Catholics possessed political power, as in New York and Connecticut, and toward the alien and the Negro; and, finally, the sense of power and importance which came to a person who felt himself one of a group whose very name inspired uneasiness and terror.

The Evans regime in the Klan's history coincides with its greatest numerical strength. Estimates of its membership ran as high as 6,000,000 in 1924. Politically it reached out for a wider territory and it became an effective issue in the political campaigns in many states. The tactics were changed and the former acts of violence discontinued to a very large extent. Interest seemed to center now in the acquisition of political power and the means to this end was the boycott of those considered as undesirables in politics and business or inimical to the Klan, the names of those to be elected or defeated being passed around at the meetings of the local bodies. In Texas the Klan succeeded in electing a senator and was an issue in the gubernatorial elections of 1924 and 1926. The Klan played an important political role also in Arkansas, Connecticut, Indiana, Oklahoma, Alabama, Georgia and Oregon. In Oregon it succeeded in passing legislation against parochial schools. Whether it has played any important role in recent years in national or state politics is difficult to state; in Texas, where its influence was greatest, it has apparently ceased to exercise any political influence and very little is heard of its doings in any other field. Whatever economic basis there was in the Klan motivation, such as jealousy of the Negro in the south and of the successful Jew and alien in both north and south, was wiped out by the shower of gold and stock dividends which fell upon the United States after 1924, and in this period most of the remaining war hysteria seems also to have disappeared. The feeling against Catholicism was a factor, however, in the Democratic convention of 1924 and also in the election of 1928, in which the presence of a Catholic

candidate and his identification with the forces opposed to prohibition caused something of a flare up of Klan activities.

Both the anti-alien and the anti-Catholic aspects of the Klan's platform have had their counterpart in earlier periods of American history. The American Party of the 1850's, generally known as Know Nothings, and the American Protective Association (A. P. A.), organized in 1887, were also primarily nativistic manifestations. Like the Klan they flourished at times of disturbance and transition. The Know Nothings arose at a time when immigration was particularly heavy, and the period of the activities of the A. P. A. corresponded with the great economic unrest which followed the close of the frontier, with the definite industrialization of America and with the wave of political protest at the end of the nineteenth century.

Whether psychologically the Klan has any fundamental resemblance to the Fascist movements and to the attendant wave of dictatorships which came over Europe in the decade between 1920 and 1930, it is difficult to say. A severe economic and moral crisis, like that which usually precedes the coming of a dictatorship, is likely to leave the existing instruments of social control utterly incapable of meeting the situation. The result is a rising to the surface of the most violently articulate elements in the community, who seek to take the place of the legitimate and ineffective instruments of law and order and who partially succeed for the same reason which brought them into existence. Having no legitimate and legal means of coercion at their disposal they resort to illegal means and undercover tactics, which give them greater power than their numbers entitle them to claim and which in time result in a great accretion in their numbers. The organization grows by cumulation until a crisis either makes it succeed or breaks it up. Fascism succeeded, but Ku Kluxism has apparently ceased to exist as a menace or a power.

KU YEN-WU (Ku T'inglin, originally Ku Chiang) (1613-82), Chinese historian. Ku Yen-wu was the founder of the seventeenth and eighteenth century "school of Han learning," a scientific movement emphasizing a cautious skepticism in the use of ancient documents, the value of hypothesis and the necessity of induction from wide evidence for the achievement of a new originality and a new practicality. This movement coincided in method and in time with the scientific awakening in the West but operated almost exclusively in the fields of etymology, phonetics, epigraphy, textual criticism and geography. Discarding the subjective methods of the so-called Sung learning, which had dominated Chinese thinking for five centuries, it aimed at an objective reexamination of the supposedly most ancient texts—those of the Han period (206 B.C.—220 A.D.).

During the trying period of the Manchu conquest of China in 1644 Ku Yen-wu like many of his intellectual contemporaries declined to co-operate with the ruling dynasty, preferring to spend his life in a study of the underlying causes of the national decadence and the rehabilitation of sound scholarship. At the age of fifty-four he left permanently his home in K'unshan, Kiangsu province, devoting the remainder of his life to travel, study and writing, reaching conclusions only on the basis of wide reading and personal observation of every part of north China. The results of these studies are incorporated in his most famous work, *Jih Chih Lu* (Daily jottings, 32 bks., 1676), comprising carefully formulated notes written over a period of thirty years. His special treatises on phonetics and epigraphy laid the foundation for all later Chinese studies in these fields, while his great work on geography, *T'ien Hsia Chün Kuo Li Ping Shu* (A historical geography of the empire, 120 bks., 1662), gave to this subject a practical as well as a historical importance.

ARTHUR W. HUMMEL

KUENEN, ABRAHAM (1828-91), Dutch Biblical scholar and historian of religion. In 1846 Kuenen entered the University of Leyden, where he passed his entire academic life; he became full professor in 1855 and from 1877 until his death was professor of the Old Testament. With Wellhausen he was cofounder of the still

prevailing historico-critical school of Old Testament scholarship. After 1869 he accepted the view of Graf, also maintained by Wellhausen, that the so-called Priestly Code of the Pentateuch was the latest of the pentateuchal documents. Together with Wellhausen he defended the posteriority of the entire Priestly Code, not merely of its laws. Thanks to his careful and penetrating scholarship combined with a remarkable capacity for synthesis he was able to apply the Hegelian theory of historical evolution to the religion and literature of Israel more completely than was Wellhausen. Both Kuenen and Wellhausen were indebted to Vatke for their inspiration. By far the ablest of the scholars who adopted the new theory, they have left their names indelibly stamped on it. Like Wellhausen, Kuenen held that before they became monotheists the people of Israel passed successively through a nomadic stage, in which they were animists; an early agricultural stage, in which they were henotheistic devotees of a nature cult; and a later agricultural stage. The later agricultural stage was the age of the prophets, who were followed by the legalists just before the Babylonian Exile.

KULIZHNY, ANDREY EVMENEVICH (1878-1919), Russian cooperative worker. Kulizhny studied at the Institute of Forestry in St. Petersburg but was soon expelled for participating in "illegal" student activity. Ordered to leave St. Petersburg he returned to Poltava, where he worked as an agronomist of the zemstvo and attained some distinction in teaching

the peasants improved methods of cultivation. In 1906 he was again imprisoned for political activity among the peasants. On his release from prison he entered the Commercial Institute in Moscow, acting at the same time as secretary of the Moscow committee on rural industrial and credit associations. In 1913 he was elected member of the executive board of the Moscow People's Bank in charge of the commodity department which served as the center of the buying and selling operations of the agricultural cooperatives. In 1917 under the Provisional Government he was assistant minister in the Department of Food Supply. He edited the *Vestnik kooperativnikh soyuzov* (Bulletin of the cooperative unions) from 1915 to 1917.

Engrossed in practical work in the field of cooperation, he wrote little and his few publications were devoted primarily to practical ends. He believed that the liquidation of a natural economy which was a survival of serfdom and the consequent development of production for the market would increase the economic opportunities of peasant farming, and advocated the formation of cooperative societies to aid the peasant in securing the necessary means of production, to familiarize him with rational methods of cultivation and finally to organize the marketing of his products.

Gurevich; *Kooperativnyi sbit produktov selskogo khozyaistva* (Co-operative marketing of agricultural products) (Moscow 1913, 3rd ed. 1918); *Organizatsionnaya skhema kooperativnogo stroitelstva v oblasti selskogo khozyaistva* (Plan for the cooperative organization in agriculture) (Moscow 1918).

KULTURKREIS. See DIFFUSIONISM.

KUNFI, ZSIGMOND (1879-1929), Hungarian socialist and educator. Kunfi was a teacher of literature in a provincial high school but resigned his position after a conflict with Count Albert Apponyi, then minister of public instruction. He went to Budapest and soon became the most influential journalist and orator of the Social Democratic party and editor of some of its most important organs. Although an orthodox Marxist he was an admirer of the French spirit. During the World War he opposed the Central Powers and expressed the conviction that the Hapsburg monarchy would be dismembered. After the collapse of the empire he became min-

ister of public instruction in the Hungarian republican government of Count Károlyi. Influenced by the Russian Revolution although he did not accept Bolshevism he became the leader of the left socialists and the moderate leader in the Soviet government of Béla Kún. He felt, however, that this experiment would lead to disaster and subsequently reproached himself for his share in it. Under the White terror of Admiral Horthy he was the last to flee. In Vienna he was an influential teacher in the Workers' College, and as an editor of the *Arbeiter-Zeitung* he led a strenuous fight against the reactionary regime in Hungary and against Fascism in general. In the Second International he was an authority on Danubian problems. Kunfi was primarily interested in a radical educational and political reform in Hungary, the indispensable condition for which, he insisted, was the democratic alliance of workers and peasants against the feudal regime of the landed proprietors.

OSCAR JÁSZI

KUOMINTANG. The Kuomintang, or Nationalist party, is the revolutionary and nationalist party of China, which since 1924 has become the most vigorous political element in the country. Its success has by no means resulted merely from a sudden expression of nationalism but represents the growth of a revolutionary movement which dates from the closing period of the Manchu dynasty. The empire of the alien Manchus had become enfeebled in the late nineteenth century through its inability to cope with the problems created by foreign commerce and by the impact of modern ideas from the West and from Japan; and it was further endangered by the growing power of the great Chinese viceroys, by the opposition of the secret societies and by the extensive Taiping Rebellion. Tardy and timid reform movements proved of no avail; there were, however, conscious efforts at revolution in the activity of a small propagandist organization, the Hsing Chung Hui (Association for the Regeneration of China, 1894-1905) and in the larger T'ung Meng Hui (Revolutionary Alliance, 1905-11), which developed from it and which later became the Kuomintang. Loose in organization, these societies owed much to the attractive personality of Sun Yat-sen. Although they had no stable base in China they worked

successfully among the large bodies of Chinese students in Japan; among the prosperous and awakened emigrants around the Pacific; among the Chinese population of foreign possessions and settlements, such as Hongkong and Shanghai; and among scattered groups in China proper. By 1911 the T'ung Meng Hui had won 300,000 adherents.

The ideology of these societies had as its factual basis the needs of China and as its intellectual basis modern political and economic achievement and theory, the latter as adapted from the West by Sun Yat-sen, Wang Ching-wei and their associates. They urged a Chinese national regeneration in opposition to the rule of the Manchus and foreign imperialism and demanded democracy in government, "equalization of land-ownership" in a form of single tax and a collectivist economic advance to relieve poverty. After several fruitless uprisings the T'ung Meng Hui succeeded in affecting the army with its propaganda and in 1911 was able to stimulate and organize local military risings into a movement which resulted in a superficial combination of all China south of the Yangtze in a revolutionary republic. Sun was its provisional president and Nanking its headquarters. The conspirators now became an open political party, the Kuomintang, which absorbed smaller reform groups. The victory was, however, far from complete, for the principles of the Kuomintang had not as yet obtained a firm hold upon the Chinese masses; and the period from the revolution until the reorganization of the party in 1924 was marked by a continuous struggle against the forces of reaction.

In order to devote himself to the economic reconstruction of China, which he regarded as the necessary concomitant of political progress, and in order to unite the north and south Sun resigned in 1912 in favor of Yuan Shih-k'ai, the strong man of the imperial regime, who had furthered the constitutional movement in Peking and secured the abdication of the Manchus in 1912. Although he agreed to observe the provisional constitution Yuan proved an arbitrary executive and was continually challenged by the Kuomintang majority in the legislative bodies. The "second revolution" of 1913, fostered by Sun Yat-sen as a protest against the unbridled actions of Yuan, was a diffuse military revolt in the south, which resulted in the destruction of the only troops upon which the Kuomintang could depend. Yuan became president and expelled Kuomintang members from the parliament, whereupon Sun established among his

followers an opposition group known as the Revolutionary party, which helped to counter Yuan's dynastic ambitions with new revolts. When Yuan died in 1916 and the provisional constitution was restored, the old Kuomintang members returned to struggle in the parliament against various cliques of military chiefs; but after a series of inglorious disputes the entire parliament was dissolved in 1917. In the next year old Kuomintang leaders and allied generals set up in Canton a Southern Constitutionalist Government, which was constantly interrupted by military dissensions.

The party was at a low point when in 1919 it received a new impetus from the independent student movement, from national agitations against Japanese policies in China and from the weakness and complicity of the Peking government. By military shifts the Constitutional Government was again set up in Canton in 1921 with Sun as "president of the Chinese republic," only to be crushed a year later by Sun's former mainstay, General Ch'en Ch'ung-ming. The failure of the Kuomintang even at its southern base seemed complete, although its propaganda for a modern centralized government as opposed to the decadent military feudalism of the north had spread widely.

In the year 1922-23 Sun sought help for the Kuomintang in the form of western military organizers and technical aids; only Russia found it politic to assist him. Russian diplomatic representatives had already spread Communist party propaganda among students in the north of China and among the laborers of Chinese ports; now they expected to profit by strengthening the Kuomintang in its attacks upon the capitalistic powers and to gain favor for Communist work in China on the rising tide of organized nationalism. The Kuomintang sought an effective co-operation against the privileged powers and above all a revolutionary technique for the achievement of the long desired control of China. In January, 1923, the Soviet ambassador Joffe and Sun published their basis of understanding, which recognized that the Kuomintang still maintained its own principles as goals. Late in that year Sun and his followers made a fresh start in Canton, while Borodin with the backing of the new Soviet ambassador Karakhan began his effective efforts as high adviser to the Kuomintang. The first party congress in January, 1924, was a fairly representative body, which formulated for the party an impressive manifesto of policy and a constitution. Communists who

accepted nationalist principles were admitted to the Kuomintang, although the latter did not include Communist principles in their program. The reorganization of the party was aimed at correcting its serious deficiencies, its lack of solidarity in organization, program and propaganda and its dearth of military resources.

The new program, which was strongly influenced by Borodin's ideas, called for strict discipline and unity with great emphasis upon energetic, popularized propaganda. Sun's lectures on the *San Min Chu I* (tr. by F. W. Price as *The Three Principles of the People*, Shanghai 1927) were a part of this phase. These principles, which were accepted as the goals of the Kuomintang, were nationalism, democracy and the people's livelihood. Nationalism signified for Sun a cultural and spiritual as well as a political union of the Chinese, which should be able to maintain its independence against foreign states. A governmental system was to be established in which four popular controls—suffrage, recall, initiative and referendum—guaranteed democracy, while the government was to work through five separate administrative powers—legislature, judiciary, executive, examination (civil service) and control (impeachment and audit). Although in Sun's *Fundamentals of National Reconstruction* emphasis was laid upon self-government in the *hsien* (local district) and province, in practise the struggle to gain power and to check enemies has furthered centralism. To insure the people's livelihood economic equality was to be sought through equalization of landholding, prevention of monopolies in land and encouragement of co-operation. Sun felt that capitalism, while necessary, should be under strict regulation in the public interest. He considered that even foreign capital is desirable to speed economic progress, but that it must be firmly directed by a sovereign government. Sun also proposed in his *Fundamentals* that the process of reconstruction be divided into three stages: the first, directed toward the establishment of order, would be under the control of a military government; the next was to be a period of political tutelage, during which the revolutionary leaders were to rule; while the final stage was to witness the establishment of popular sovereignty. These ideas were embodied in a brief popular form in the party manifesto of 1924.

After the reorganization the Kuomintang was rebuilt on the lines of the Russian Communist party with local units leading up through indirect elections to an annual party conference (actually

held in 1924, 1926, 1929 and 1931), which in turn was to select central committees as ad interim directing bodies. In practise the Standing Committee of the Central Executive Committee has tended to be the effective organ of the party oligarchy, while the local units have been agencies for carrying out its will rather than the truly constituent sources of its authority. A political training school for party organizers and propagandists and Whampoa Military Academy, a military school for the training of nationalist officers, were established. Laborers and peasants were organized for "popular movements" and special attention was given to women and young people. Separate bureaus were set up for the organization of these groups as well as of the oversea Chinese and the army and navy men; nationalist armies were trained. In general a tremendous burst of activity characterized the Kuomintang immediately after its reception of Russian aid.

Certain elements continued to resent the rise of the Communists and their supporters, but the new policy was dominant in November, 1924, when Sun accepted the invitation of the northern government to attend a rehabilitation conference. He died amid the contentions of would be leaders in his party. Borodin now became exceedingly influential. He utilized the skilfully stimulated public sentiment over the Shanghai and Shameen clashes with foreign interests in May and June, 1925, the large body of radical and partly armed laborers maintained as "strike pickets" in Canton and the "political officers" assigned to supervise each military unit. The Central Executive Committee expelled from the party the important conservatives, who then organized the Western Hills Conference near Peking. They hoped to secure the adoption of their anti-Communist program at the Second National Congress but were unsuccessful: in fact the Communists continually strengthened their hold upon the party. Chiang Kai-shek stood out among the radicals, and in the Whampoa Military Academy he produced revolutionary officers of a new quality. But he showed an independent will, and preparations for military and political advance to the north were interrupted in March, 1926, by his anti-Communist coup. He and Borodin were forced to cooperate, however, in an endeavor to secure control of the north, the goal of both the Nationalist armies and the political organizations. By March, 1927, Russian methods of propaganda and Chiang's military activities profiting by the division of opponents

had won their way well into the Yangtze valley. Borodin and the radicals used Hankow as the center of a government increasingly like that of Soviet Russia. Meanwhile Chiang tried to set up a new base under moderate Chinese control and in April succeeded in doing so at Nanking with the support of Shanghai bankers; his success marked the victory of the military element in the Kuomintang and the end of the Communist-Nationalist alliance.

The Nanking regime claimed to be a restoration of the true Kuomintang through the elimination of the Russian and Communist elements. Control by the military and the suppression of radical "popular movements" were scarcely disguised. The Hankow faction, surrounded by opportunist military leaders and discredited by the revelation of orders from Moscow, melted away when Borodin's Chinese group expelled him in July, 1927. The union of almost all the center and right groups in and with the Nanking party and the military was finally achieved after laborious efforts. This union made possible in 1928 the advance to the north of the Kuomintang armies and their allies. The Kuomintang was thus in control of a large part of the country, and although the party was sadly diluted and dependent upon regional military leaders, there existed an opportunity for a real Nationalist government of China.

In October, 1928, the Central Executive Committee adopted the "organic law" which set up the "five-power government" following Sun's political system. In Kuomintang terms, the "military period" of war upon the old regime had been completed and the period of "political tutelage," in which the party was to teach the people how to exercise political rights, had begun. This period would end, it was announced, in 1935. During the period of tutelage the party is to act in the place of a representative organ and sovereignty is to be vested in the party congress. Wholly or largely from their own membership the Central Executive Committee and the Central Supervisory Committee named a Central Political Council which appointed and instructed the chief officers of the national government. The "five powers" were organized into five administrative departments or councils, *yuan*. In form the national government is an agent of the party with no status of its own. Actually there is much repetition of personnel in the highest units of party and government and the leaders of the Nationalist movement have turned somewhat from the party as a means of revolution to the

government as a means of control. Nationalism, anxiety for reform, the tradition of officialism and self-interest, all support bureaucratic tendencies in a land which is divided and confused. Armies and revenues are in the hands of the national or regional governments, upon whom the party depends for protection and funds. The new political experiments have gained a limited success, continually endangered by civil wars and by regional, factional and personal rivalries. The modifications of December, 1931, emphasized party control and the separation of powers by making each of the five *yuan* directly responsible to the Central Executive Committee. In actual administration the government and military leaders are semi-independent, particularly in the regions which are distant from the capital.

The significance of the role of the Kuomintang in Chinese national regeneration is difficult to gauge. It has achieved general success in arousing the more alert of the Chinese people against the Manchus, military feudalism and foreign control. It has also greatly increased the concern with economic and social progress, usually in collectivist terms; and through the state control of schools, through the reform of textbooks and curricula with their emphasis upon natural science and social and political subjects and through the required study of the *San Min Chu I* under party members it has exercised considerable influence upon education along modern and national lines. The actual accomplishment of the nationalist ideals has been hindered by the uneducated, unorganized and poverty stricken condition of the vast, dispersed population. Soviet revolutionary technique and partial militarization, which together gained for the Kuomintang its precarious supremacy, brought with them the spread of Communism, the splitting of the party, the accommodation of an idealistic program to the power of generals and to regionalism. Within the Kuomintang's comprehensive aims still exists the peril of dualism; some members wish primarily for a political revolution and oppose radical social change, while others stress social reorganization and attack the political leaders as capitalists and feudalists. In addition to the serious difficulties created by regional movements the party is torn by factional-personal strife and continual use of force or intrigue; indeed there are no two leaders of importance who have remained working companions throughout the critical years. Since the reorganization of 1924 the gross membership of the Kuomintang has

averaged about 450,000, or one in a thousand of population. During the period of "popular movements" from 1924 to 1927 the party included a fair number of laborers and peasants, but in general the members are chiefly actual or expectant functionaries, officeholders in the party of the government, military officers, soldiers, teachers and students. More than half are under thirty; about one fifth have a secondary education; 3 percent are women. The Kuomintang has exercised authority for only a short time and it has encountered tremendous obstacles. Its position is perilous not only because of the menace offered by certain foreign powers but because it has developed desires for good government, national prestige and prosperity far beyond its ability to fulfil them. It has boldly assumed exclusive responsibility for the nation, but despite the relatively high ability of certain of its leaders it is still doubtful whether such a dispirited and faction ridden body will be capable of sustaining its great burden.

LABAND, PAUL (1838-1918), German jurist. Laband was the most representative teacher of public law of imperial Germany. From the eastern part of the empire, where in 1864 he became professor at Königsberg, he was called to the newly founded chair in Strasbourg in 1872, which he continued to occupy until his death. As member of the first chamber and of the council of state of Alsace-Lorraine he remained

in direct contact with the political relations of those provinces.

Laband's importance in intellectual history rests on his attempt to found public law as a pure legal discipline. This implied a turning aside from political and sociological factors and the abandonment of a metaphysical basis; there was to be sought a scientific objectivity and freedom of evaluation. By following this course Laband became the true founder of the so-called conceptual jurisprudence (*Begriffsjurisprudenz*) in public law. Adopting the mathematical procedure of the natural sciences, he endeavored to show from the postulates of the existing law that his conclusions were logically inescapable. Any contrary conclusion rested thus not upon different ethico-political assumptions but was entirely false and due to error of thought and calculation. There was present at the same time in this conviction the liberal belief in the possibility of the purging of all differences by the method of intellectual discussion, a belief which on its side went back to the law of nature. In the final result this procedure necessarily placed legal form, as essential in itself, above content and led to a misunderstanding of the political, religious, metaphysical and economic background of the law as well as to the stifling of all sense of public policy.

Laband's system signified the proclamation of the purely intellectual man as the ideal jurist. But it attained the appearance of scientific objectivity only because the political differences within the bourgeoisie of imperial Germany were relatively slight. Present day doctrine in Germany has turned aside from the positivistic *Begriffsjurisprudenz* and once again clearly perceives the irrational, historico-metaphysical background of the state. On the other hand, in Austria the pure jurisprudence of Kelsen has led to its revival and further extension, so that to a certain extent Laband still represents the focal point of the struggle. In any event the great clarity and the admirable construction of Laband's theory of public law were recognized by his opponents as well as his disciples, and it ruled German *Staatsdogmatik* for a full half century.

LA BOÉTIE, ÉTIENNE DE (La Boétie) (1530-63), French political theorist and litterateur. La Boétie, the adored friend of Montaigne, was born at Sarlat and died of the plague at Germignat. His principal contribution to mankind was a treatise called *Discours de la servitude volontaire*, or *Le contr'un*, which he wrote at the age of sixteen or, according to another edition of Montaigne, eighteen. As the investigations of Joseph Barrère have convincingly proved, the work was partly intended as a refutation of Machiavelli's *Prince*, published in 1532. The reason for its failure to mention Machiavelli was the fact that Catherine de' Medici, who then dominated the French court and to whose father the *Prince* had been dedicated, was a great admirer of the famous Florentine. The *Discours* constitutes at the same time an eloquent protest against political tyranny and a profound analysis of the genesis of human servitude, a term by which La Boétie designates the position of those subordinated to a government aiming only to gratify the desires of the governing person or group. According to its main thesis servitude is, to use a modern term, a type of political behaviorism which has resulted from the distortion of the original free nature of man by long governmental drill and pseudo-religious education. La Boétie describes the complicated political mechanism and network of corruption enabling the tyrant to maintain his antisocial domination. In conclusion he points the way to liberation through passive resistance. He declares that political servitude is voluntary; it can be terminated if those in bondage withhold their support from the tyrant.

La Boétie subsequently became a councilor in the Parlement of Bordeaux, then the supreme judicial body of this region. Under the pressure of the growing absolutism of the French king and of constant religious persecutions and civil wars the *Discours* remained unpublished except for brief excerpts until it was included among the pamphlets collected as *Mémoires de l'estat de France* by the Huguenot pamphleteer Simon Goulard in 1574. Montaigne omitted it from the edition of La Boétie's work published eight years after his friend's death; when the prudent skeptic mentioned it in the 1580 edition of his own essays (bk. i, ch. 28) he sought to minimize its importance by describing it as a literary exercise.

This extreme caution of Montaigne aroused the suspicion of A. Armaingaud, who tried to prove (in *Revue politique et parlementaire*, vol. xlvii, 1906, p. 499-522) that the real author of the *Discours* was not La Boétie but Montaigne himself. Armaingaud contends that Montaigne used the name of his dead friend as a kind of pseudonym in his fight against the hated regime. This hypothesis seems, however, to be without sufficient evidence. In the meantime the *Discours* had profound repercussions as a circulating manuscript and influenced some of the later monarchomachs. Although La Boétie himself was not a Huguenot, his pamphlet, deeper and more profound in its denunciation of tyranny than any of the numerous writings which the French religious persecutions of the period evoked, provided the fleeing Huguenots after 1572 with an ideological weapon. Its later history varied in different countries. The Anglo-Saxons regarded it as little more than the rhetorical exercise of a youth who knew his Seneca; certain eminent Frenchmen have extolled the beauty and force of La Boétie's argument; Tolstoy exalted him as his precursor. According to Landauer the work was the first systematic formulation of the message later developed by Godwin, Stirner, Proudhon, Bakunin and Tolstoy. Passages in the *Discours* sound like a critique of the Fascist and Bolshevik dictatorships.

OSCAR JÁSZI

Works: Among the editions of La Boétie's complete works are those by Léon Feugère (Paris 1846), and by P. Bonnefon (Bordeaux 1892), who has also published a new edition of the *Discours* (Paris 1922). The *Discours* was translated into English (London 1735).

W., *A History of Political Thought in the Sixteenth Century* (London 1928).

LABOR. The valuation placed upon labor is a significant element in the ideology dominating any period, for it reflects the social structure as well as the scale of social values. Primitive peoples, especially warlike races, often display a marked disinclination toward labor; the necessary work devolves upon the women and upon foreigners, particularly those captured in wars and feuds, who are treated as slaves. It is only in a hierarchically organized society, however, that labor acquires a specifically

social character. Slavery existed as a social institution in Asiatic and in European antiquity, in despotisms and in democracies. The immense buildings erected by the Asiatic despots or by the Egyptians represented the labor of armies of slaves, as did at a later period the factories of the Roman magnates, the silver mines in Spain or the fleets of Roman galleys. Slavery existed also in the Greek city-states, where the culture of the upper classes was possible only on the basis of slave labor. In all these very different social systems labor which today would be considered socially valuable was looked upon with disdain. This attitude is reflected in the biblical quotation: "In the sweat of thy face shalt thou eat bread" (Gen. III: 19). In the Asiatic despotisms contempt for labor became contempt for all performance. The names of great artists remain unknown; only the names of ruling kings are preserved. In ancient Greece the laborer even when he was a citizen was scorned as a creature of low breeding. In contrast is the high esteem in which the peasant was held in ancient China and Japan; here he ranked next to the knights and the learned classes, although he might be only a tenant laboriously eking out a bare existence.

The lowly position of labor in most ancient societies was the result in large part of the institution of slavery. Since citizens and slaves worked side by side, for instance, as artisans, the contemptuous attitude toward slave labor extended also to the work of the free citizen. In Rome the emergence of the skilled laborer and even of the skilled slave effected a loosening of the system, for it became necessary to give to slaves possessing special capacities a certain interest in their work, to provide them with better living conditions, considerable independence and at least the possibility of purchasing their freedom. This development, which undermined the old organization of labor, serves to substantiate the contention that real slave labor can be only undifferentiated mass labor controlled by physical force.

With the disintegration of slavery, hastened and extended by the appearance of Christianity, the way was paved for a conception of labor as possessing peculiar dignity and worth. The early Middle Ages marked the rise of the guilds with political rights and defensive capacities unknown to the corporations of antiquity. The guilds soon became the carriers of a peculiar ethics of labor. They created the structure within which developed the professional pride, the

appreciation of one's own labor, the justification of wealth by labor, which distinguish the bourgeois from the feudal mentality. The fact that labor was valued only as professional labor was another result of the guild organization of society. Although the guilds did extend into more fields than is generally realized, all labor outside of corporations and guilds was looked down upon and abandoned to the arbitrary action of officials. The independent artisans, the "outsiders" (*Bönnhasen*), the workers not legalized by guild organization but nevertheless often of great importance to the economic system, were held in contempt—until through a radical change in ideology free enterprise attained the highest esteem, while guilds and trade organizations sank into disrepute.

The powerful influence of the guilds and the political alliances they built up, at first spontaneously and later consciously, brought about a new attitude on the part of organized religion; the church now became a staunch supporter of the guild system. Christianity, however, like all other ethical religions was (according to Max Weber) originally anti-economic; it recognized no dignity in labor and looked upon work as only a means of livelihood. The New Testament exhortation to "walk worthy of the vocation wherewith ye are called" (Eph. iv: 1) is an expression of indifference. For the monks labor became a means to the ascetic life but it had no positive meaning, no value in itself. Although the guilds in the cities were able to temper this indifference to some extent, no complete transformation was effected until the rise of Protestantism. With the abolition of the cloisters Christian virtues could be practised only within lay institutions. An explicitly positive valuation of labor and its products and therefore also an esteem for economic dynamics itself first found expression in Puritanism. Calvin denied the independent importance of "good deeds," holding that these do not guarantee the achievement of grace, of eternal felicity, which is determined by an obscure and impenetrable decision of God but is nevertheless indicated by the success of the individual in the affairs of the world. An individual can best attain the state of grace by working "methodically" in everyday life for the glory of God. Asceticism, particularly in the form of rational work, became the supreme duty; and thus was introduced into everyday life esteem for labor, for the product of labor and finally for wealth. Wealth was valued not as a means of enjoyment

but as the warrant of a mode of life agreeable to God. This approach, however, led soon to the positive valuation of abstract acquisition, of profit for its own sake; in short, of a capitalistic conception of life.

With the development of the science of political economy the concept of labor received an independent significance. Although in the doctrines of Adam Smith and of Ricardo (the system of the physiocrats applied more to agriculture than to agricultural labor) labor appeared only as one of the elements of the economic process it was nevertheless considered as preeminently the source of productivity. Later when it was made the principle of value formation labor acquired an extra-economic significance, which can be seen most clearly in Marx' theories. According to the classical economists labor like land and capital is a factor of production. It is simply the human factor. In Marx' doctrine the concept of labor becomes, as do all economic concepts, a social category. For Marx labor is the achievement of the workers, not simply of all who work, and more particularly of those workers who in different social systems—as slaves, as serfs, as members of the guilds and finally as workers in shops and factories—by their work first made possible the creation of social wealth and thus the existence of the ruling classes. According to Marx the capitalistic profit economy rests upon the proletariat as the wage earning class, the surplus value of whose labor is appropriated and controlled through the legalism and the price mechanism of capitalist economy, as the surplus labor of slaves or of serfs was controlled through political force. Labor under the capitalist economy has only a fictitious freedom. In reality propertyless labor is narrowly limited by the market economy, continually reenforced by social coercion.

The marginal utility school of economists went back to a socially indifferent conception of labor as one element in the economic system. Recently, however, among this group too there has been a tendency to consider labor in its social form, as a propertyless wage earning class. All the anticapitalistic currents of the present time tend to lead scientific thought in this direction. Indeed once the social character of labor has been recognized, it is impossible to consider it outside of the social structure.

The various attitudes toward labor are of course very closely dependent upon the social

and economic status of the laboring masses in any particular society, while at the same time they help to create that status. The conception of the value of labor constitutes a determinate ideology, the source of which is not to be found merely in the actual state of the society or in the interests of its members. It has already been pointed out that in ancient Greece the institution of slavery necessarily diminished the esteem for labor, even influencing the whole structure of society, which came to be based on local instead of professional organization. This contempt for labor completely erased the differences between skilled and unskilled labor which are so important in modern thinking. In India—to choose a totally different social system—the religious castes were at the same time bearers of definite labor functions, and thus quite irrational values were placed upon different kinds of labor. Each of the several thousand castes has its own *dharma*, or code, which determines its rank and which is itself conditioned by the character of the profession. Thus types of labor which are respectable in Europe are in India regarded as very low when they are performed by low or "impure" castes. On the other hand, impurity of caste often reflects the character of the profession.

The valuation of particular kinds of labor has varied greatly throughout history. In Japan and China agriculture is the most respectable form of manual labor. In Europe the development of urban culture resulted in a contempt for agricultural work. While agriculture is praised as the source of means of subsistence, workers on the land, especially peasants, are looked upon with a certain disdain because of their lack of culture. European feudalism especially built up an ideology according to which only the idle life of the aristocrat was noble; the peasant, "the coarse fellow" and the city worker, the Philistine and the petty trader, were all treated with contempt. Thus a feudal system based upon the labor of others leads to an ideology which scorns all labor and so furnishes a moral justification for its own existence.

Until very recently the learned professions have been regarded quite differently from other forms of labor. Indeed as long as the ability to read and write was rare, the profession of writer or even more of jurist, priest, physician or state official was not considered as "work." If the members of these learned professions often held a not very enviable position in the courts of princes they were treated with marked

respect by the people. Only bourgeois society has really emancipated these professions and it has even put them in a dominant position for long periods. The fact that they lost caste in the second half of the nineteenth century was due in part to the increase in the number of intellectuals and in part to the fact that, as the legislative, administrative and economic institutions created by this epoch and adapted to its spirit became more and more intelligible and accessible, the aura which had surrounded Roman law and its practitioners in the sixteenth and seventeenth centuries faded, and the social status associated with all professions based on classical culture declined.

Special concern for labor as we find it in the modern world developed only with industrialism. Mass labor in ancient Asia, in Greece, Egypt and Rome was the object of despotic control. A benevolent attitude toward labor can scarcely be said to have existed. In the feudal period there was a more human attitude toward the household servants but not toward the serfs. The fate of the latter varied according to locality, the quality of the soil and the character of the people, but everywhere they were looked down upon and exploited. The so-called emancipation of the peasants was not a struggle on their behalf but for their domination. The state wanted to give them certain opportunities toward economic development in order to obtain higher taxes. The conception that society is founded on labor was no more prevalent in the Middle Ages than in antiquity. In the guilds interest centered in the work done by the master, his personal contribution; both journeymen and apprentices expected to become masters, so that the idea of socially inferior labor was almost completely absent. It is true that occasionally there were strikes and movements of opposition among the journeymen, but their aim was not to suppress the guilds but only to improve their standard of living within them.

Only with the formation of a proletariat composed of free individuals, propertyless and concentrated in large masses, did the labor problem become the very center of the social problem. The first industrial workers were recruited from among the proletarian weavers, then from among the unemancipated agricultural workers, the independent artisans and so forth. They were a motley crew working under a system of mechanization and division of labor, under the orders of foremen who were often brutal. Personally and formally, however, they were free;

they could when they found work elsewhere leave their jobs at any time. They were not attached to a locality or to a factory, and they could better their situation with improving business conditions. They were the first great class of society that forged or suffered its destiny outside of legal chains. As whole cities were erected around the factories, the workers increased in number more rapidly than did any other part of the population. Indeed the rapidly increasing wealth resulting from industrialization was made possible only by an ever growing working class. It was therefore natural that the question should soon arise as to the part played by labor in the process of the creation of wealth and as to its rightful share in the social product.

Since Adam Smith and Ricardo political economy had placed labor in the center of the theory of value. Consequently there had arisen the problem of the part played by land and capital in the creation of value. Karl Marx declared that the income from land and capital must be considered theoretically as a deduction from workers' wages. The marginal utility theorists took as their point of departure consumption rather than the cost of production and found the source of value in the valuation of the product by the consumer. Neither theory answers the question of the relative productivity of labor compared with that of other classes. All modern economic theories recognize that labor produces value, industrial labor as well as agricultural. There remains only a controversy with regard to the significance of economic leadership—the labor of management and coordination. When the technical aspect of modern production is taken into consideration, it is impossible to deny the necessity of cooperation and coordination. Particularly in large scale production impossible without special organizing ability which can assure the efficiency of the technical processes, establish a plan of production and make decisions about necessary changes in the industry. Within the capitalistic system production on a large scale, especially increasing production, cannot be achieved without the work of owners or managers and their staffs of superior and inferior employees. There can then be no absolute answer as to how the product can "justly" be distributed among these groups of producers. Actual salaries and wages always depend partly on the monopolistic position of a given industry; under a system of free competition they would be quite different. There are no

"natural" wages, since, as Marx knew, in every system the level of wages is influenced by "social and historical factors"; that is, by the existence of monopolistic organizations. The conception of the participation of labor in the creation of social wealth can thus be considered only as a general leading principle in the distribution of that wealth.

The actual organization of labor has varied greatly in different periods. It is likely that among many primitive races there was no conscious organization of work, which was done with very primitive tools and with little attempt to develop more practical methods. Moreover labor in primitive societies, especially in tropical countries, is closely related to religious rites and to artistic activities. For technical, often even for psychological, reasons the greatest part of primitive labor is performed collectively, by a working group, for which songs or the rhythmic striking of an instrument regulate and guarantee the performance of a given quantity of work. Such group work exists today in transportation, agriculture and similar occupations. The organization of labor among primitive people is based either on the family—the large family in itself makes possible a certain division of labor—or for religious work and eventually for work done for the leader of the group, which frequently assumes a religious significance, on a larger unit.

Only when society became more differentiated socially and economically did the various classes of laborers acquire specific social status. Then such distinctions became marked. The separation between agricultural and industrial labor occurred as a result of the division of labor on the large estates of antiquity as well as on the mediaeval farms burdened with the *corvée*. The soil yielded a sufficient surplus to provide not only for the agricultural laborers and tenant farmers but for spinners and weavers, blacksmiths, carpenters, masons, shoemakers, tailors, carpet weavers, coopers and many others employed in the lord's household. Specialization of labor was the rule, developing most markedly in the guilds. Karl Bücher estimates that there were nearly two hundred separate professions at the beginning of the fifteenth century. The guild was not merely an organization of labor and industry but also a political corporation. The guilds endowed chapels in the newly built churches; they armed their members; each guild defended its part of the city walls; guild representatives sat in the city councils.

The industrial revolution could not have occurred within the guild system. Factory industry and to an even greater extent mechanized industry required freedom in the utilization of market opportunities, in the employment of working forces. The guild regulations and customs which had to a certain degree protected the journeyman and the apprentice had no validity in the factory; hence the early days of capitalism witnessed an immoderate use of women's and children's labor without limitation of the working day, conditions which were unknown at the height of the guild system. The workers in the early factories were unskilled or only partly skilled; some had had previous handicraft training. For a long time, however, the different trades remained distinct; indeed the transformation of trade unions into industrial unions is only a very recent development. It is in the so-called new industries—the automobile industry, the machine industry and the like—that the organization of workers according to industries rather than trades has proceeded most rapidly. As a result labor organizations have become more strongly colored by a general class character and the workers have become class conscious rather than profession conscious, although membership in a trade is still of importance and although, especially in Europe, even at the present time many workers are first trained as handicraftsmen.

Of equal importance with the union of different trades within the factory in developing a new status and a new conception of labor was the mechanization of industry. At first the artisans resisted the introduction of machinery and destroyed the machines which deprived them of their bread. But when as a result of the rapid spread of factories and of increasing demand for workers for the construction of railways and new industries unemployment decreased or disappeared, there developed the theory that new forms of production automatically absorb all the workers thrown out of jobs as a result of technological improvements. This theory was largely accepted by the trade unions and created among the workers a more tolerant attitude toward the introduction of machines and the mechanization of industry. Since the World War keener theoretical analyses and added experience have brought this theory into disfavor. There is an increasing realization, especially among the working classes, that technical progress must be controlled.

Modern industrialism first created class con-

sciousness among the workers. The importance of the trade, of the kind of work performed, has become secondary to the common class destiny of all workers. It is true that class consciousness is frequently weakened or delayed by differences of profession, of ability, of the relative importance of particular industries; by divisions of sex, age, race and nationality. In the principal industrial countries, however, these differences undoubtedly tend to lose their importance for social action, especially since increasing competition makes ever more acute the struggle of the various classes for their share in the social product, while local and professional differences in the levels of wages, even for skilled and unskilled labor, are gradually diminishing. On the other hand, the psychological currents conducive to the development of class consciousness have thus far had little opportunity to affect the salaried employees, who constitute an increasingly larger portion of the dependent class. Moreover in many European countries, especially in Germany, the workers are more sharply divided by different social philosophies—socialistic, communistic, Christian—than by differences of trade or industry.

In organization and in efficiency of labor the present epoch represents the highest stage of capitalistic economy yet attained; never before in history have productive forces been so fully developed. At the same time never before has the great bulk of the working masses been so aware of its situation and so united as a class. This solidarity has become international, however, only in the last few decades. Whereas in previous centuries only scholars (through the Latin language and humanism) and the nobility (through the French language and common class interests) were internationally united, modern means of communication and modern methods of production have created an international solidarity of producers, both capitalists and workers.

Within each of the great industrialized nations the working class has become for the first time in history an important economic and political force. The World War greatly hastened this development. Far from wiping out class stratifications it greatly increased the influence of the working class. This first resulted in a rapid increase in the wages, and thereby an improvement in the standard of living of the working class, and in a multiplication of collective contracts. As the working class, at least in Europe, has become an active and decisive

factor in politics, the very principle of capitalistic economy has come into question. The problem as to whether the organization of production should be entrusted to the capitalist alone is being discussed on all sides. Indeed the importance of the proletarian movement lies in the fact that it has brought into actual discussion the problem of the economic structure of society. Certainly this problem is far more significant than that of the level of wages or of the share of the working class in the social product. The conception of an organization of the entire economy in the interest of society as a whole has been gaining more and more adherents since the war and especially since the crisis which began in 1929. In particular the development of the Soviet planned economy has spread the idea of such an economic organization and has thereby greatly enhanced the significance of labor in modern society.

LABOR BANKING. Labor banks are incorporated profit making institutions carrying on a general banking business the majority of whose stock is owned by one or more trade unions as organizations. They are to be distinguished from people's banks or cooperative credit organizations—voluntary non-profit mutual aid associations organized to provide credit on a personal basis—which have functioned for many years in Europe, in some of the Asiatic countries and to a lesser extent in the United States. While the proponents of American labor banking utilized the achievements of people's banks as convenient propaganda material, they did not emulate the cooperative features and purposes but conformed to ordinary banking practises. The two types of popular banking moreover differ in their class character: cooperative credit organizations are essentially middle class institutions, while labor banks are an aspect of the institutionalism of organized labor. Labor banks are also to be distinguished from cooperative banks, such as the Cooperative Wholesale Society Bank in England, which do not accept purely business accounts and act mainly as bankers for the cooperative movement.

Although labor banking reached its highest development in the United States, whence it influenced the formation of the most important

European labor bank, the Bank der Arbeiter, Angestellten und Beamten of Germany, the first labor bank was organized in Belgium in 1913. Belgian credit unions despite their growth had never been closely identified with the trade unions, except through individual members. The Banque Belge du Travail was organized to carry on a general banking service for trade unions, cooperatives and the Labor party, which also owned the stock of the new institution. The bank has a number of branches and in addition to a personal banking service ministers to the financial needs of labor, cooperative and industrial enterprises, from which it also receives deposits. There were no new labor banks until after the World War. A labor bank was organized in Denmark in 1919, in Norway in 1920, in Palestine in 1921 and in Austria in 1922. The stock of the Palestine Workers Bank is owned by the Zionist World Organization and the trade unions, while in the case of the other banks the stock is held by trade unions and other labor organizations; no individual ownership of stock is permitted. While labor party and cooperative organizations may own stock in the labor banks, their ownership and control are essentially trade union.

European labor banking is most highly developed in Germany, where there are three labor banks. The Deutsche Volksbank, organized in 1921, is conducted by the Christian trade unions, while the Deutsche Wirtschaft Bank, organized in 1923, is under control of the Hirsch-Duncker trade unions. Both banks are relatively small. The most important of the labor banks is the Bank der Arbeiter, Angestellten und Beamten, organized in 1924; five years later it had resources of 163,180,000 marks and a turnover of 2,787,000,000 marks. This bank is controlled by the central organization of the German trade unions, the Allgemeiner Deutscher Gewerkschaftsbund, with a minority stockownership by the Deutscher Beamtenbund and the Deutsche Krankenkassen. The Bank der Arbeiter, which has made substantial progress since its establishment, receives deposits from the affiliated organizations and finances enterprises conducted by trade unions and cooperatives. Another bank, the Deutsche Landvolk Bank organized in 1923, is not strictly a labor bank as it represents the employers as well as the Zentralverband der Landarbeiter.

The opening of the Mount Vernon Savings Bank with \$160,000 capital and \$40,000 surplus in the Machinists' Building in Washington, D.

C., on May 15, 1920, is generally viewed as the actual beginning of the labor banking movement in the United States. This is not actually correct, however, as the sponsoring union, the International Association of Machinists, owned the bank only in part and a majority control was secured by inclusion of the considerable holdings of the leading union officers. Labor banking as a nation wide movement may properly be said to have begun on November 1, 1920, when the Brotherhood of Locomotive Engineers' Cooperative National Bank opened for business in Cleveland with \$651,000 paid-in capital. Under the influence of Warren S. Stone, who had studied the people's banks in Europe, the Brotherhood of Engineers had decided as early as 1915 to open a labor bank at the opportune moment, but the World War delayed realization of the project. The Amalgamated Clothing Workers of America was the next large union to join in the movement; this organization opened one bank in Chicago in 1922 and another in New York in 1923. The Engineers' banking activities expanded rapidly. Within a few years they had launched several more banks, bought a large interest in an important Wall Street bank and branched out into a variety of subsidiary and collateral banking, investment and real estate ventures. Their activities involved tens of millions of dollars of capital investment and ran into a general turnover of hundreds of millions of dollars in sales of stocks, bonds and other securities.

Unions affiliated with the American Federation of Labor joined the banking movement slowly and half heartedly. Its leaders viewed with disfavor the diversion of union funds and energies into extraneous channels that were not well charted. As far back as 1904 the federation rejected a motion to organize several labor banks where unions could deposit their funds. The proposal was again rejected ten years later and again in 1918. But the spectacular success of the Engineers' banks or, more accurately, the publicity which made their quantitative success appear as a qualitative success weakened the resistance of the A. F. of L. leaders. In 1923 the Federation Bank of New York opened for business with \$500,000 capital and surplus subscribed by practically every A. F. of L. international union. It claimed to be "the most representative union labor bank in the country." Nevertheless, the central leadership of the A. F. of L. continued its warnings against the new financial attraction. By 1926 labor banking had

reached its peak; there were then thirty-six labor banks with a combined capital, surplus and undivided profits in excess of \$13,000,000 and total resources close to \$130,000,000. Connected with the banks were a number of investment trusts and securities companies, and a considerable number of banks were proposed or partially promoted. This development of labor banking was greeted by the financial community with general friendliness mixed with indifference. Many thought the new banks might attract the hoarded savings of workers and that they might also increase the conservatism of organized labor. In some cases, however, general friendliness rapidly turned into hostility; thus one important labor bank faced with a severe run was told by the Clearing House Association, to whom it appealed for aid, to "go to the labor unions for help and not ask the bankers," although up to the moment it closed the bank was declared solvent by the comptroller of the currency. The clearing house refused to do for a labor bank what it later did for commercial banks in the city.

American labor unions were prompted by several motives in organizing labor banks. The years 1920 and 1921 were marked by aggressive open shop drives. Labor leaders felt that bankers were behind the drives against the very unions whose money their banks carried, capitalized and made profit on. The conviction was widely held that labor could retaliate effectively if it mobilized its financial resources to serve labor's own ends. Walter F. McCaleb, first vice president of the Engineers' Cooperative National Bank, suggested that "if 20,000,000 workers were each to save \$1 a week and regularly deposit this money in their own institutions, this whole civilization of ours would be changed within the next five years." Peter J. Brady, president of the Federation Bank of New York, estimated that "of \$25,000,000,000 annually paid in wages to workers in American industry, from \$6,000,000,000 to \$7,000,000,000 is saved in various ways, and that labor banks hoped eventually to control." Taking into account the large accumulated funds and approximately \$25,000,000 paid out annually in various benefits, the unions considered that a better return on their resources could be secured by organizing banks and going in for investment. The unions would render their people a genuine and appreciable service by creating investment institutions for the savings of labor.

In addition to the purely financial considerations the unions envisaged an extension of union

power into new fields. Conservatism or progressivism was not the line of division between the leaders who favored labor banking and those who opposed it. Rather it was a division between the labor activists and their more passive colleagues. Labor banks could do more than extend financial help to unions engaged in strikes or lockouts; with their financial resources they could help "fair" employers who recognized the union and thereby strengthen unionism. One of the purposes of the International Association of Machinists in organizing its bank was to render financial assistance to an employer who was unable to secure credit through the regular channels because he recognized the union; and this specific case was generalized in labor bank policy. Some of the labor leaders had greater objectives; they believed it was within the power of labor, if all the workers' money was mobilized by their own financial institutions, to make substantial inroads into the money control which they considered oppressively exercised by Wall Street. Others hoped to get on the controlling boards of industrial enterprises which were unfriendly to organized labor and convert the respective managements to a more cordial attitude. To accomplish this end they aimed to utilize the power of their banks as money lending institutions and also to secure the confidence of employee stockholders and act as their proxies in the determination of the corporations' labor policies. Warren S. Stone saw labor entering upon a new, third cycle of development. The first cycle or phase, a stage necessary for the development of group solidarity, had been characterized by the growth of class consciousness; the second, a phase which "necessitated a period of warfare involving the use of force, sometimes economic, sometimes physical, on both sides," by defensive struggles for recognition of unions and for the principle of collective bargaining. The third cycle upon which labor was entering was "one of cooperation rather than war, and the most striking evidence of this phase is the labor bank." This program was an expression of the ideology of the "new capitalism," which influenced both labor and capital in the period before the depression which set in in 1929. Several labor banks emphasized the development of institutional services to the workers, such as character loans at reasonable rates of interest and with equally reasonable demands as to collateral security or the financial standing of comakers, long term loans to home builders and the financing of cooperative housing developments.

The decline of the movement, which began in 1927, did not at once become evident. On the eve of the depression early in October, 1929, there were still in existence twenty-three labor banks with a total of capital, surplus and undivided profits well over \$10,000,000 and total resources of \$110,000,000. Three banks, representing about 45 percent of the total capital of all the labor banks and an even larger part of the total resources, led in the field: the Federation Bank and Trust Company of New York, the Engineers' Cooperative National Bank of Cleveland and the Amalgamated Bank of New York. But the Engineers' enterprises were in bad shape. They had lost many millions of dollars in questionable investments, in the organization of holding companies, in speculative land investments in Florida. Gross mismanagement and corruption were revealed. The imposing structure of banking and investment institutions collapsed involving enormous losses to the union and heavy special assessments on the members. Moreover the Engineers' enterprises were no exception. Labor banks proved vulnerable to temptations of speculation and excessive profit making, and they neglected the importance of competent banking personnel. The business depression revealed the weaknesses of the movement and caused many more terminations. By December 31, 1931, there remained in the field only seven labor banks with total resources of \$30,000,000, including capital, surplus and undivided profits of \$3,615,000. The three largest banks were the Amalgamated Bank, the Telegraphers' National Bank of St. Louis, Missouri, and the Mount Vernon Savings Bank.

The weaknesses which led to the collapse of the labor banks are in general weaknesses of the labor movement itself, from whose characteristic division of forces and crossing of purposes the banks suffered. Many banks fell prey to the game of union politics and disregarded the problem of competent non-political management. The essentially capitalist orientation of the American labor leaders led to imitation by labor banks of high pressure speculative and promotional methods. Although the labor banks started with many cooperative features in their charters, these were soon forgotten. It was originally planned to limit the number of shares an individual could own, to limit the declarable rate of dividends and to prorate a share of the profits to depositors, all with a view to restricting profit making and forestalling individual domination of labor banks. But in performance in most cases

the cooperative features were amended out of existence or modified beyond recognition in favor of the practises of unrestricted business enterprise.

Nor did the labor banks receive the confidence and support of the workers. The workers did not choose to deposit their savings (enormously exaggerated by the labor bankers) in labor's financial institutions, which were in some cases presided over by leaders who had failed to achieve much success in fields supposedly their own. Labor men together with liberal professionals sympathetic to labor supplied less than one third of the labor banking business. The volume coming from small business men attracted to the labor banks, because they offered credit facilities on easier terms than did the commercial banks, meant temperamental, panicky withdrawals and frozen assets in times of crisis.

While the American labor banks underwent their dramatic rise and fall, the European labor banks made steady progress. In the two years 1928 and 1929 the Bank der Arbeiter, Angestellten und Beamten increased its deposits 50 percent; in the same period there was a decline of 31 percent in the combined resources of the American labor banks. The difference in development reflects important differences in organization and policy. The European labor banks are centralized, national institutions organized under control and enjoying the protection of the whole trade union and labor movement of their respective countries. The American labor banks were primarily decentralized local institutions organized and owned either by single national unions or by local groups of unions and individuals who appreciated the profit making opportunities and contact values of the business. European labor banks moreover were primarily established as auxiliaries and service agencies of the labor movement. They do not have the profit making outlook of commercial banking business. A large volume of labor banking business awaited them: management of the funds of the unions, of the political party and of the well established consumers' and producers' cooperatives. Investment in municipal and other social enterprises offered an outlet for surplus funds. If under these circumstances profits were not likely to pile up rapidly, security and solvency were not easily jeopardized. The American labor banks on the contrary were primarily business enterprises organized to provide profitable financial opportunities for the national union or the local group which operated the bank. As small banks they

could secure only the left overs of the business which the large banks were not anxious to handle. A few labor banks sought to establish institutional services in special areas of activity, but the majority operated as small competitive banks at a time when small banks had to fight hard to survive. Both the financial situation and the character of the trade unions in general militated against the permanent success of American labor banking.

LABOR BLACKLIST. *See* BLACKLIST, LABOR.

LABOR-CAPITAL COOPERATION emphasizing the harmony of interests between labor and capital aims to reduce or eliminate conflict of interests, to regularize production by preventing strikes and so to increase labor's output as to benefit both wages and profits. It is part of the understanding under most labor-capital cooperative relations that a share of the gains of cooperation will on some calculable proportional basis accrue to labor; in addition labor

is offered the further advantage of stability of employment. The practise which the term represents comes third in the evolution of labor-capital relations—non-recognition of unions, collective bargaining, cooperation to insure more efficient production and, in the larger aspects, social peace.

Labor-capital cooperation may assume forms which repudiate independent unions or collective bargaining and involve the direct subordination of labor to capital. This occurred in the United States in the period after the Civil War, when labor-capital cooperation was urged as an offset to unionism; it still occurs today in many industries where "cooperation" is forced upon the workers through company unions and employee representation schemes. This involuntary cooperation prevails also in Fascist Italy, where cooperation functions through unions organized and controlled by the government and not through independent unions of the workers. In more representative and progressive usage, however, labor-capital (and in the United States labor-management) cooperation represents an industrial relationship in which labor and capital recognize one another's independence and voluntarily agree to cooperate in common tasks. Capital concedes to labor the right to organize and act through its own representatives; labor assumes an active interest in and sometimes partial responsibility for the progress of production. In this sense labor-capital or labor-management cooperation constitutes an advanced phase of collective bargaining.

The term labor-management cooperation in American usage or in the alternative form union-management cooperation presupposes recognition of unionism as an independent force cooperating with management as does the term labor-capital cooperation in the European sense. Both rest upon recognition of unionism and collective bargaining. The one covers an American orientation, the other is characteristic of the European labor mind. Capital, when conjoined with labor, tends to emphasize the social aspects of industry and ownership, the contest of property rights and class interests behind the immediate issues of cooperation; hence labor-capital cooperation assumes general political forms and operates on a national scale, concerned with larger issues and solutions. The use of the word management rather than capital, while it expresses the unusually high development in the United States of functional separation of capital ownership and management, also denotes an

engineering or technological approach to the issue and implies interest in the immediate advantages of a simple bargain relationship. Labor-management cooperation consequently is animated by an essentially parochial spirit, ignores larger social issues and is unconcerned with property rights and class struggle.

The forms and development of cooperation differ greatly in American and European experience. The range of difference is from mere elaboration of traditional collective bargaining by the creation of additional, better equipped and permanently functioning machinery for realizing the ends of all trade agreements—industrial peace and uninterrupted production—to some participation of labor in the management of production. While in its major concrete aspects labor-capital cooperation represents no basic departure from the general course of orthodox unionism and collective bargaining, its theoretical implications and social ramifications are considerable, particularly as they are revealed in European experience. Although influences and efforts striving for labor-capital cooperation were at work, theoretically and practically, for many years before the World War and gained in momentum as socialism in Germany, syndicalism in France and laborism in England grew in power and importance, the specific practise now covered by the term took shape under the impact of forces generated by the World War and accelerated during the post-war period. These forces were the intensified application of science to industrial processes and the emphasis on rationalization, mass production of consumer goods and the consequent intensification of competition in both the home and world markets, the precarious state of business in many countries and of certain branches of industry in nearly all countries, the growing unemployment due in part to technological labor displacement in industry and agriculture, the rapid growth of labor unionism in particular and of the power of labor in general, and the strengthening of revolutionary tendencies in certain countries.

As the forces and conditions which led to cooperation did not arise simultaneously in all countries or operate everywhere with equal effect, the forms and objectives of cooperation have varied in time and place. In the United States labor-capital cooperation in the involuntary form imposed upon labor by company unions and employee representation plans developed out of the same general forces which produced voluntary cooperation in Europe.

Labor-management cooperation, however, was a product of the unusual American prosperity which flourished from 1923 to 1929; one of the results of prosperity was to weaken unionism, thus forcing the consideration of new policies (among them, for example, labor banking) and influencing labor leaders to propose cooperation with management as one method of strengthening the unions and collective bargaining.

The vital distinction between American and European experimentation with labor-capital cooperation is this: in most American cases, typically sporadic and local, it was primarily labor which sought to induce capital to cooperate, while in the European experiments, planned and national in scope, capital sought labor's cooperation. Trade unions in the United States, insufficiently organized and practically eliminated from the basic industries, sought to realize on capitalist prosperity by endeavoring to convince management that greater efficiency could be achieved by winning the workers' good will. Without the additional advantage of power in politics, such as is yielded by the influential political parties which labor controls in most European countries, American labor was able to use only moral admonitions and warnings against possible disaster. The distinction reflects differences in the character of the respective labor movements: European labor has appeared in the practise and discussion of labor-capital cooperation as a distinct social class striving for power, while the American practise and discussion of labor-management cooperation have avoided social theory, emphasized labor's local interests and stressed the purely business aspects of cooperation.

The practise of labor-capital cooperation reached its fullest development in Germany. During the World War, when *Burgfrieden* was urged upon labor and capital, voluntary joint associations of employers and workers, known as *Arbeitsgemeinschaften*, were organized to effect cooperation between labor and capital; they were, however, dissolved in 1924. Meanwhile economic decline aggravated international competition and the pressure of reparations and forced consideration of an elaborate program of rationalization. For such a program it was necessary to secure the consent and cooperation of German labor, which was strongly organized in both the economic and the political fields and enjoyed legal status as a class. Unwilling or unprepared to stake its fortune on the overthrow of capitalism, German labor accepted labor-capital co-

operation on a give and take basis. The declaration of the German General Federation of Trade Unions and General Federation of Unions of Salaried Officials stated conditional terms of acceptance in the form of specific demands: real wages must rise; management must work closely with the work councils (shop organizations which have legal standing in Germany); social hardships resulting from rationalization must be compensated; rationalization must be carried out in each industry as a whole; prices must be reduced; opportunities for promotion of workers must be provided as well as assurances given that the management will be efficient; comprehensive unemployment insurance must be guaranteed; wealth must be taxed directly and adequately; tariffs on imported foodstuffs and raw materials must be reduced; a planned credit system must be provided to meet new conditions in industry. Having outlined so complete a program of labor-capital cooperation, German labor simultaneously set forth its socialist view of the limitations of cooperation: "So long as private enterprise exists, it will produce economic classes which will struggle against each other to decide their respective shares of the proceeds of industry. We hold this struggle to be unavoidable, because an impartial scientific agreement on this question is not possible. But without prejudice to this view we also believe that, for the solution of various economic, financial, social and political problems, a joint effort by all parties is worth while with the object of overcoming the present crisis and developing the productive capacity of German industry." Through this cooperation the unions expect increasingly to acquire functional power in industry and thus gradually to realize the new social order. While the revolutionary elements in the German labor movement, organized in independent communist unions and the Communist party, regard labor-capital cooperation as an abandonment of the class struggle and surrender to capitalism, Catholic labor unions have been in line with their general ideology and traditional attitude the most persistent exponents and faithful followers of the idea that capital and labor are constituents of a single organic whole and that there must be an essential harmony of interests between employers and employees.

As in Germany the problem of labor-capital cooperation acquired new significance in Great Britain during the World War. One result was creation through government initiative of the Whitley councils, which were intended to form a

sort of industrial parliament, give labor some representation in management and realize peace and cooperation between labor and capital. The councils were partly an answer to the radical workers who during the war had formed shop committees acting independently of the trade union administrations. Whitleyism never acquired any real practical importance. The problem of labor-capital cooperation assumed new significance because of the decline of British industry in the post-war period. Discussions of the problem eventuated in 1928 and 1929 in two conferences, known as the Mond-Turner conferences; Sir Alfred Mond (Lord Melchett) was head of the employers' group and Ben Turner, chairman of the General Council of the Trades Union Congress, was head of the labor group. The conferences were brought about by the uncertain state of both capital and labor. Several important industries were facing virtual collapse under the joint pressure of German rationalized industry and American mass production and superior wealth in raw materials. The labor movement was considerably weakened by the collapse of the general strike in 1926 and the defeat of the miners' strike. It was generally felt that traditional trade union methods did not have much positive achievement to offer. The supporters of cooperation argued that labor could not watch indifferently the breakdown of industry and production, England was not a self-sufficient country, rationalization and the consequent strengthening of industry were issues of primary importance and labor's position would eventually be stronger if it made itself a part of the rehabilitation process. Furthermore they did not anticipate an immediate and complete breakdown of the capitalist system but rather a slow, long drawn out wearing away of its strength, out of which new developments might come, temporary and partial revivals; hence, it was argued, labor would profit by taking an active part in this evolutionary development. Against this the opponents of cooperation contended that it was not the business of labor to help decaying capitalism to gain a new lease on life. Even if an immediate collapse might be averted and a temporary restoration of the functioning of the capitalist system achieved, it would sooner or later break down again under the weight of the conflicting forces which operate in the social order and labor might as well face the basic issue now rather than endeavor to postpone the unavoidable; if labor embarks upon the cooperative venture it will not save capitalism or prevent

eventual disaster, and by acting the minor partner in the capitalist game it will take the edge off the class struggle, demoralize its own ranks and throw in jeopardy its chances in a final struggle for power. The Mond-Turner conferences conceived labor-capital cooperation as involving discussion and joint action on rationalization, unemployment, labor supply, the organization and control of industry, and other social and economic problems of industry as well as of wages and hours. Mondism, as this policy of cooperation came to be known, involved full recognition of bona fide labor unions, something like representative government in industry by means of work councils, employee stockownership, conciliation of industrial disputes and machinery for continuous investigation, criticism and conference. There was strong opposition to the conference plans among a minority of the trades unions and even stronger opposition among influential groups of employers. This opposition and Sir Alfred Mond's death resulted in the collapse of the movement.

Labor-capital cooperation in England and Germany and to a lesser extent in other European countries is the result of economic decline and the increasing power of labor. Where labor is strongly entrenched capital is compelled to secure labor's voluntary cooperation in order to put through necessary measures and avoid disputes which may further weaken an already weakened economic fabric. On the other hand, labor can no longer concern itself exclusively with hours and wages: in a period of economic decline labor is forced into larger action—either cooperation with capital or the overthrow of capitalism with labor assuming the responsibility for social reconstruction. Labor-capital cooperation is thus the alternative to revolution.

In the United States the unions suggested cooperation as a means of strengthening their position, but the offer was accepted by management mainly as a means of solving certain aspects of the modern work process involved in scientific management. In non-union industries scientific management might be imposed upon the workers by means of company unions and similar devices, but in union industries it depended considerably upon overcoming union opposition by accepting cooperation—a much narrower consideration than that involved in European labor-capital cooperation. This is the most important reason why none of the American labor-management cooperative ventures has been large enough to assume to deal with the

whole labor-capital issue or with all the problems of an entire industry on a national scale. Their cooperative content ranges from rather narrow and technical agreements, seeking to fortify collective bargaining by labor assisting in waste elimination and increased output, to schemes which carry a measure of authority for labor in determining work terms in relation to the state of the business. In no case does labor assume any real measure of industrial control. Labor-management cooperation in the forms thus far developed is applicable only where labor is still appreciably skilled and the workers' initiative can increase output; it is, however, inapplicable to mass production industries where the workers are paced by the machine.

The B. and O. Plan, best known of all American labor-management cooperative experiments, originated in 1923 in the Glenwood repair shops of the Baltimore and Ohio Railroad, whence it spread so that by 1931 it was actively in effect in the mechanical departments of four major railroad systems of the United States and Canada covering about one sixth of the combined mileage of the two countries. The B. and O. Plan, as interpreted by its leading exponent, Otto S. Beyer, rests on three main principles: mutual recognition by labor and management and their cooperation for improved service and elimination of waste; fair division by labor and management of the gains of cooperation; and stabilization of employment and perfection of joint administrative machinery to promote cooperative spirit and effort. Liberal interpreters of the B. and O. Plan were at one time willing to see in the extension of the arrangement a gradual process of substituting workers for owners, with industry eventually operated with capital "hired for a fixed and guaranteed wage," thus abolishing the profit motive, and with efficiency of operation maintained by the cooperation of "trained and conscientious management, public regulation with adequate standards of performance, and the enterprise of organized labor seeking its ends through better service." The really potent urge on the part of management to view the B. and O. Plan with favor sprang from the technical peculiarities of the maintenance and repair departments of the railroads. In 1928 the outlay for this part of work on Class 1 carriers in the United States comprised 26.4 percent of total operating expenses, decidedly a large expenditure. It was reasonably expected that willing workers inculcated with cooperative spirit and anticipating tangible gains would

do better work than contractors or workers devoid of that incentive and would thus increase efficiency, regularize production and reduce disputes. This proved to be true, but it has also been generally admitted that "the companies receive more lucrative returns from the practises of cooperation than do the men." As to stabilization of employment, it is not by any means certain that the B. and O. Plan accomplished any more than ordinary collective bargaining could achieve. There were in some instances other motives favoring cooperation; the government owned Canadian National Railways, for example, wanted to rally the political strength of labor in support of the experiment in nationalization against the efforts of private business interests trying to thwart it.

Another labor-management cooperative experiment, the National Council on Industrial Relations for the Electrical Construction Industry, was constituted in 1920 with an equal representation of employers and the union, the International Brotherhood of Electrical Workers. The workers' right to organize was accepted as basic in the arrangement, but simultaneously the abandonment of the "philosophy of power and struggle" was emphasized. The industrial philosophy of the council reduces the major causes of disputes between workers and employers to intermittent and shifting employment, price competition and the lack of any general and active understanding of the indissoluble partnership which exists in industry between management and labor; the council seeks to remedy these evils. After ten years of experience with the National Council on Industrial Relations resulting in an almost complete lack of tangible achievements, the Electrical Guild of North America was formed with a view to further more aggressively "industrial cooperation in the electrical construction business on a scale hitherto unknown and untried." An authoritative spokesman for the union thus describes the guild plan: "It insures democracy by dealing with the voluntary society of the workers; it guards management by making it the central source of power in the industry; it establishes industrial government without aid of the state; it secures stability without fixity; it elevates craftsmanship and technology to places of prominence. It has features not dissimilar to those of the once-projected Guild Socialism, with the added virtue of being a going concern." To which might be added "and free of the vice of tending to weaken vested interests."

The case of the Rocky Mountain Fuel Company closely cooperating with the United Mine Workers of America is interesting in its inclusion in the cooperative plan of sales promotion by labor. It is in a way a case of labor-management-consumer cooperation. This arrangement followed a protracted sanguinary struggle against unionization wages by the company under an earlier administration, together with other coal companies in Colorado. The organized labor movement in the state and the Colorado Farmers' Union actively assisted the company to market its coal as encouragement to a corporation which recognized unionism in the midst of a non-union coal center. The general public was converted to that view with the result that the company's retail sales grew considerably. This plan is obviously limited in its application, since the competitive advantage of labor's help in consumer sales would disappear if the plan embraced any considerable number of companies in the industry.

In the X-Construction Plan in the men's clothing factories of the Hart, Schaffner & Marx Company of Chicago, introduced by the company and the Amalgamated Clothing Workers of America in 1924, there appeared elements of labor responsibility for production with a share in control over industrial and business policy. Although spread over a limited area the X-Plan was the farthest step taken by labor-management cooperation in the United States. Under the arrangement which remained in force for several years the union assumed responsibility for a major part of the production process, namely, the tailoring of the garments after the raw material left the cutting rooms. It was a clear case of rationalized production under joint labor-management auspices with the main objective of cheapening production costs and lowering selling prices of the product so that larger sales, re-orders and consequently more work in the shops might be achieved. The workers relinquished certain customs and rules restricting output and expected to be compensated by the gain in volume of available work and the relative employment security that would follow increased sales. The cooperative contribution of the union consisted in placing at the service of the business the workers' accumulated industrial competence, which enabled the company to meet customer style requirements with progressively smaller labor costs and substituted team methods and machine work for costly individual handwork. The larger objective of the experiment

was to stabilize employment by supporting a large scale industrial enterprise against the reckless competition of non-cooperating employers. Yet the union could not logically withhold its cooperation from other manufacturing concerns, however keen their competitive practices, if they agreed to deal with labor on a union basis. Hence only one objective of union-management cooperation, stabilization of employment conditions, was met, and that only in part; the major objective, that of defeating reckless competition, was not achieved.

The economic depression which began in 1929 dealt a severe blow to those proponents of labor-management cooperation who saw in the practise a means of solving the fundamental issue between labor and capital. On the other hand, the experience of cooperation, wherever it was practised by strongly organized union groups, demonstrated the positive contribution which labor interested in the production process as a whole can make to industry if its efforts are not blocked by the operation of the profit motive. This positive demonstration of the value of labor's interest in production has given practical meaning to the issue of economic or social planning, which would take into account all the factors in the productive process. It has also emphasized the significance of the power element in the situation: economic concessions are not secured by moral invocations. Carried on in times of normal business activity, labor-capital or labor-management cooperation need not, as its opponents claim, take the edge off the class struggle or cause a loss of labor militancy, provided the area of application is a whole industry or the whole of national industry and cooperation is seen as one aspect of larger issues. The additional competence that labor gathers in the controlled exercise of cooperation is an asset not unlikely to prove of determining significance in the struggle for power. The relation of cooperation to the theory of "harmony of interests between labor and capital" is not necessarily generic, but it is tangent. The acceptance by strongly organized unions of a cooperative plan of procedure need not signify an *eo ipso* abandonment by labor of all opposition to the social status quo, although experience indicates that it undoubtedly tends to tame the manifestations of opposition.

LABOR COLLEGES. See WORKERS' EDUCATION.

LABOR CONTRACT. Narrowly defined a labor contract is an agreement, express or implied, between an individual worker and an employer under which the former agrees to perform work

in return for compensation. Entry into the contract creates a relationship of master and servant or, in more modern terms, of employer and employee which entails mutual rights and obligations. These may be mentioned only in the broadest outlines or not at all in the individual contract itself but are defined by certain external controls, such as custom, judicial decision, legislation and collective agreement, and are assumed to form part of the contract. In so far as the individual labor contracts which prevail in a given legal-economic system thus largely conform to a common set of arrangements, it is possible to speak more broadly of "the" labor contract which characterizes the system.

Slavery, serfdom and forced labor are types of employment relation in the determination of which contract plays no part. In ancient society with its predominantly slave economy even such contracts for free labor as were made reflected the characteristic arrangements for the renting or maintenance of slave labor. In feudal society the typical employment relation was serfdom, under which the villein, or peasant, was born into a status from whose customarily determined obligations he could escape only under exceptional circumstances. Gradually there emerged a class of unattached agricultural and town laborers who were in a position to sell their services. Typically, however, the terms upon which they might do so were fixed by custom, guild regulation or law and not by contract. In England the Ordinance of Laborers of 1349 limited the wages that might be paid to agricultural laborers and workers in certain trades, compelled them to accept employment and in other ways determined their status. As early as 1381 in the Peasants' Revolt the demand was made that labor contracts should be free of legal restrictions. But it required four centuries of time and the dissolution of a subsequent widespread control over the employment of craftsmen and laborers of all sorts, established by the Statute of Artificers in 1562, for the peasants' demand to become an actuality. With the coming of the industrial revolution the system of free individual contract was established as the dominant type of employment relation.

Implicit in the concept of the labor contract is the idea that both parties are not only legally but actually free to bargain for terms and equally able to grant or withhold as they see fit the services or economic opportunities which they control. The resulting contract then represents the terms of the greatest mutual benefit, based

on the genuine consent of the two individuals. Such an ideal is measurably attained in the type of agreement whereby the services of a responsible manager or technician are procured by a business organization. Such a bargain frequently is concluded only after extended negotiations have led to the mutual acceptance of specified terms. A maximum of freely established elements thus is present in the ensuing employment.

In the great mass of labor contracts in the present economic system, however, although the parties are legally free to bargain for terms subject to limited control by law and collective agreement, economic necessity drives them together and along with other forces compels workers and less frequently employers to accept conditions which they have had little or no share in establishing. Market forces, custom, public opinion, collective bargaining and legislation play far more important roles than personal negotiation in dictating these contracts. By the time of the establishment of the free labor contract in England the legally liberated worker, who was forbidden to combine with his fellows, often had to face an employer with whose economic power he could not cope. The worker simply offered his labor, which must be sold both because it was highly perishable and because he had no other means of existence. The employer possessed capital that was more lasting and that increased his power of resistance, and he generally had an oversupply of workers from which to choose. This situation was later aggravated by the emergence of corporations and of large scale businesses as employers in all important industries except agriculture. Similar conditions accompanied the development of industrialism in the other occidental countries and have since spread into the Orient.

The history of the labor contract in the western world during the past century aside from the progress in abolishing slavery and forced labor is largely a story of efforts to introduce formal controls in the interest of the workers and of counterefforts to preserve individual bargaining as the only acknowledged determinant of employment relations. The simple contract of employment has increasingly been recognized as primarily a means of entry into a relationship whose characteristics have been determined previously and may be altered later, analogous in some ways to the "contract" of marriage. Hence improvement in the terms of the relationship has been sought partly through legislation, embodied in safety and health acts, laws regulating

the dismissal of workers, minimum wage and maximum hour laws, workmen's compensation and unemployment insurance legislation and other measures. At the same time certain employers have voluntarily improved the position of their employees not only by reducing hours and providing better working conditions but also by introducing company supported welfare work and pension schemes. More recently a few prominent employers have undertaken to guarantee a minimum amount of employment each year. Some concessions spreading through an industry or occupation have tended to establish certain customary rights of labor deriving from the labor contract, the violation of which, while not legally punishable, results in a loss of the goodwill of labor. All of these measures, however, have proceeded without regard to the shared control of the employment relation by employers and employees which the device of contract has been supposed to make possible. The effort to establish such control as a reality has proceeded largely through the movement for collective bargaining.

Collective bargaining has become possible through the removal of legal restrictions upon the right of workers and employers to organize. It has for its purpose the democratic establishment of the terms of employment relations. It seeks to accomplish this end by means of a process of bargaining between employers, acting singly or in groups, and organizations of workers, thus bringing about negotiations between two parties or sets of parties whose economic strength has some approximation to equality. Where this process succeeds it results in controlling agreements which take many forms ranging from informal understandings to written contracts enforceable at law. The collective agreement is not a contract of employment. Of itself it puts no one to work and fills no jobs. It is rather legislative in its effect upon employment, for it binds the parties to bring about the introduction of its terms into the labor contracts to which it applies. Thus, in so far as the employees' organizations are actually in their own hands, collective bargaining confers upon the workers in groups a share in controlling their employment relations which they could not enjoy individually. Moreover the evil effect of competition among employers in the matter of labor costs is diminished where a number are dealt with on the same basis.

The legal source of the strength which the workers are able to exert both in seeking to establish collective bargaining and in carrying it

forward is also the cause of their economic insecurity—the terminable nature of the typical labor contract of modern times. Since involuntary servitude has become contrary to public policy, even a contract of employment for a definite term cannot be specifically enforced. A damage suit for its breach would be of no use against an employee whose property, as is generally the case, is worth less than the legal exemption from execution. In the United States moreover the cumbersomeness and expense of legal proceedings have largely closed the door of the courts to workers. These reasons combined with the economic convenience of employers have caused labor contracts ordinarily to be made terminable at the will of either party without prior notice. Hence the simultaneous quitting of employment or shutting out of workers in furtherance of a collective negotiation is not of itself a breach of contract or other legal wrong, except where it violates the terms of a collective agreement. Neither is it an invasion of the rights of either party to a labor contract terminable at will for a third person, in furtherance of an otherwise legitimate purpose, to attempt to persuade the other party to withdraw from it. If, however, abuse can be shown in connection with any of these activities, an injunction—except as against the bare failure to offer to work or to employ—can be obtained in many states of the United States and in the federal courts. To aid in procuring this type of judicial remedy the so-called yellow dog, or individual non-union, contract has been used by numerous employers.

Preliminary organizing activity among workers having collective bargaining for its objective must be carried on by securing memberships in the labor union or at least promises to join from a considerable number of employees prior to the presentation of a demand upon the employer. The yellow dog contract furnishes a legal basis for checking this organizing activity without at the same time introducing the element of permanence into the employment relation. The essential element in such a contract is the promise on the part of the worker not to become a member of a union so long as he remains in the service of his employer. Despite the fact that the only consideration for the worker's promise is employment, still terminable at will, the courts have tended to uphold the validity of these contracts and to protect the property rights created by them. In *Hitchman Coal and Coke Co. v. Mitchell* [245 U. S. 229 (1917)] the United States Supreme Court held that efforts to per-

suade workers who were bound by such contracts to promise to join a union without disclosing their intention to their employer or quitting their jobs could be enjoined in a suit filed by the employer. Thus the power of the judiciary to enjoin interference with non-union agreements is used to frustrate organizing activity. In 1930 it was estimated that well over a million workers in the United States were bound by such contracts. Only the New York Court of Appeals has indicated, without expressly holding, that such contracts will not be protected by injunctions [*Exchange Bakery and Restaurant, Inc., v. Rifkin*, 245 N. Y. 260 (1927); *Interborough Rapid Transit Co. v. Lavin*, 247 N. Y. 65 (1928)]. The courts of other states when faced by the issue have followed the ruling in the *Hitchman* case. As a result of considerable agitation by organized labor to nullify the force of that decision Congress in 1932 passed the Norris-La Guardia anti-injunction act, which declared yellow dog contracts contrary to public policy and unenforceable by injunction or otherwise in the federal courts. The extent to which state legislatures and courts will follow this federal action remains to be seen.

The settlement of terms and conditions of employment by more or less impartial agencies of adjustment is variously provided for in modern legal-economic systems. Conciliation and arbitration may be established by law or collective agreement and may be made to apply to collective disputes or to differences arising out of individual labor contracts or to both. Where an agency of adjustment is representative of workers and employers it involves an extension of shared control similar to that which is effected by collective bargaining. Within particular establishments moreover the formation of shop rules together with control over a variety of other matters has been entrusted by law, collective agreement or voluntary concession by employers to works councils established for the purpose. In a few instances substantial participation in ownership and management has been conferred upon employees and the labor contract has thus been assimilated to the organic arrangement governing the business enterprise.

The unrelieved individual labor contract terminable at will characterizes what appears to be relatively a brief phase in the history of the employment relation. Prior to the industrial revolution employment contracts in England, in the absence of stipulations to the contrary, were presumed to run for a year. Only gradually did it

come to be established that the employer might dispense with this arrangement by rule or that a custom might authorize summary discharge. In virtually all countries the basic law of the labor contract laid down in judicial decisions or code provisions arrived at substantially the same result; but in Italy, France, Germany and other countries the movement toward a dismissal wage or notice of discharge, required either by legislation or collective agreement, has since made considerable headway. This development coupled with unemployment insurance legislation and legal provisions which make unpaid wages a preferred charge in insolvency proceedings defines the extent of the worker's claim upon the business enterprise to which he contributes, over and above his current compensation. It thus performs a function similar to the entrepreneur's or stockholder's right to the going concern value and to the bondholder's right to have the assets applied if need be to the satisfaction of his claim. A mutual obligation to give prior notice of the termination of a contract of employment does not necessarily apply to a strike or lockout, which may be considered in the same light as a layoff or shutdown, during which the employment relation may be taken to continue.

Control over employment on a democratic basis, extending even to agriculture, has proceeded farther in Germany since 1918 than in any other major country. Collective bargaining between employers and workers who are extensively organized has been encouraged by legally established conciliation and arbitration machinery and supported by well defined legal sanctions. The ultimate responsibility of the democratic state for the welfare of workers and for the steady functioning of trade and industry is recognized through a discretionary power to impose agreements in settlement of collective disputes. A statutory system of works councils fosters joint control over employment within industrial and commercial establishments. In Russia a structurally similar system serves the Soviet dictatorship both because of state ownership of the important enterprises and because of state control over the trade unions. In Italy the dictatorship makes use of a rigidly governed syndicalist organization and machinery of collective bargaining to maintain a like control over employment. In the United States individualism in the labor contract still dominates, partly because of a traditional adherence to "freedom of contract" as against both public and private control and partly because of limitations upon public

control which the courts have held to be embodied in constitutional provisions. The general tendency, however, which is being reenforced by international conventions, seems to foreshadow greater security and participation in the benefits of machine industry for the workers, whose present insecurity and inadequate compensation are an outstanding weakness of the legal-economic structure.

LABOR DISPUTES. The terms "labor dispute" and "industrial dispute" are frequently used or interpreted as having exclusive reference to a concerted cessation of work. Thus the United States Bureau of Labor Statistics, after maintaining for some years a separate classifi-

cation for strikes and lockouts, now combines the data on these mass activities under the heading "industrial disputes." The term may, however, be used in a broader sense to include all disagreements and all evidences of disagreement between employer and employees, whether or not organized activity is implied and whether or not the dispute culminates in a strike or lockout. It is in this broader sense that the term is used here.

In its most common meaning a labor dispute implies a definite employer-employee relation which still exists, although in more or less strained form, or which has only recently been broken. It may involve an employer and some or all of his employees, a group of employers in the same or related trades and their employees or, in rare cases such as that of the general strike in England in 1926, all employers and their employees over a wide economic or geographical area regardless of industrial boundaries. Thus defined, it is essentially limited in its application to the period in economic history during which the employer-employee relationship has existed, the period of the free laborer. Yet it is related historically to the unrest and discontent of the unfree workers of earlier periods—the slaves of antiquity and of the southern states in the United States, the peasants of feudal Europe and the peons of Latin America. To these unfree groups individual escape—more difficult for the slave than for the serf, especially after the rise of the towns—restriction of output or sabotage (*q.v.*) offered the only peaceable means of expressing discontent with their status in general or their treatment in particular. Group action by these unfree workers almost necessarily involved violent uprisings with considerable bloodshed. Generally such uprisings were mercilessly put down; yet occasionally they effected permanent political freedom for the workers, as in Haiti, or forced some mitigation of the former status.

Restriction of output and sabotage are avenues for the individual registering of dissatisfaction by the free worker also. Or, like the Luddite rioters, he may take his vengeance upon the machines which seem to threaten his status or his job. Another indication of unrest is found in labor turnover, resulting from the voluntary quitting of jobs or from insubordination leading to discharge.

The limitations upon the effectiveness of individual action led free labor early to seek the benefits of organization. With the creation

under the guild system of a group of journeymen increasingly less likely to rise into the ranks of the masters, there developed, sometimes within the guilds themselves but often as independent organizations, journeymen's societies established primarily to defend the position of these workers against the control of the guilds. By methods suggesting those of the modern trade union these societies tried to limit the number of apprentices, improve wages and shorten the working week. With the decay of the guild system and the coming of industrialism the journeymen's societies lost their power. There ensued a period of sporadic strikes by the new factory workers, often sponsored by organizations which sprang up just to see the dispute through and then disbanded. Gradually out of these spontaneous evidences of common discontent there developed permanent organizations ready to act as soon as a dispute arose. A permanent unionism became the principal agent of the workers in labor disputes. Even in the twentieth century, however, sporadic strikes occur by workers who have hitherto been unorganized.

A further indication of the existence of unrest and dissatisfaction among wage earners appears in their activity in the political field. The labor dispute arises primarily out of economic conditions. But these in turn are profoundly affected by the relation of government to industry, and the ability of the workers' organizations to function in an economic conflict depends in large part upon their legal status. The essentially economic labor dispute thus tends to assume a political character. To secure proper consideration of its rights labor demanded the right of suffrage and having obtained it proceeded to support either the candidates or parties which seemed to offer it the most or organized parties of its own. The former procedure is still followed in the United States, as it was in England in the latter decades of the nineteenth century; at present British labor has its own political party, and in Europe generally labor organizations are affiliated with political parties which represent their own interests.

One of the earliest concessions which the workers sought through political action was the legal right to organize and carry on their activities in the economic field as a collective unit rather than as an agglomeration of individuals. This right was not easily obtained. In most industrial countries trade unionism was at first

illegal. England took the first step toward legalizing collective labor action in 1824. The same end was achieved in the United States through a series of court decisions and in France and Germany through legislation. The attainment of the right to organize was followed in England by a century long struggle, not yet ended, for the right to function without interference by legislation or by judicial decisions. The same struggle is evidenced in the United States in the attempts of the unions to restrict the use of the injunction and the "yellow dog" contract. In varying degrees the political demands of labor in different countries have come to include attempts to secure through legislative action improvements in the status of labor which could be secured only with great difficulty or not at all through economic action. The growing body of labor legislation represents the fruit of this activity and constitutes an important factor in the elimination of certain causes of labor unrest.

Dissatisfaction over wages seems to be the most important immediate cause of labor disputes. In slightly more than half of the strikes reported to the United States Bureau of Labor Statistics, in two periods together covering forty-one years, some aspect of the wage question has been involved; the wage question has motivated more than twice as many disputes as any other cause. In other countries for which records are available the matter of wages occupies a position of similar importance. This is in part a reflection of the whole area of industrial hazard. Concentration on the effort to secure higher wages undoubtedly has its origin not merely in dissatisfaction over the wage rate itself but also in a consciousness of the danger of work interruptions of every sort, which constitute interruptions in earning power. This fear of loss of stability in earning power is emphasized also in the establishment in many labor agreements of seniority rules, for the protection of workers longest in service. Other well recognized causes of disputes are such matters as the length of the working day or week and other factors generally described as "working conditions." These include shop conditions affecting comfort, safety and health.

But no concise categories can include all the causes of strikes. The British Ministry of Labour before the World War reported strikes for such reasons as the refusal of an employer to let miners attend the funeral of a fellow worker killed at work, the unwillingness of employees

to work with certain individuals involved in a family quarrel or with foreigners and a demand for the suspension of a policeman who had arrested a workman for using obscene language. Often the more significant causes of unrest do not appear among the listed causes of strikes in the official reports. A denial of what is believed to be "justice," extremely discourteous treatment by persons in authority or an invasion of "rights" may lead to strikes of unusual duration and bitterness. In the United States some of the most violent strikes have followed refusal by an employer to confer with a committee of workers, refusal to answer communications from employees or their representatives, discharge of members of workers' committees asking for an adjustment of grievances and discharge of persons joining unions.

An underlying cause of industrial conflict is the more or less active consciousness of lack of status on the part of wage earners generally. It is this lack of status which makes for economic insecurity and at the same time accentuates the sense of injustice arising out of objectionable conditions of any sort. The achievement of a condition of freedom, while securing to the worker individual rights of incalculable importance, failed to provide him with the right of access to the means of livelihood. The most important new individual weapon was the right to refuse to work under the terms offered. Among organized workers quitting was and is the common individual response to dissatisfaction with working conditions. But this "freedom to quit" is often entirely theoretical. It depends primarily upon the ability to obtain a new job. In periods of great unemployment or in sections which are devoted to one industry and in which the employers maintain a blacklist, the right to quit is frequently tantamount to the right to starve. Where a particular type of labor is employed by one firm only, quitting entails the loss of all the advantages of acquired skill and training.

The employer may deal with industrial unrest by ignoring its existence or repressing its manifestations by disciplinary methods, including dismissal and the use of the blacklist. This procedure, although not generally approved by progressively minded employers, may have the appearance of success when labor is plentiful or when artificial barriers to labor mobility exist, as in isolated centers or in one-industry towns. At almost the opposite extreme is the method of collective bargaining, having as its purpose

an adjustment which will be acceptable to both employer and employee.

Between these two methods is that of anticipating dissatisfaction by considering the needs of the workers and attempting in varying degrees to meet them. When offered as a form of philanthropy, as in certain types of industrial welfare work, or as a thinly veiled "sop to Cerberus," such methods sometimes create rather than allay dissatisfaction. Intelligently managed personnel departments, on the other hand, organized on a frankly business basis and devoid of pseudo-philanthropic motives may do much to lessen unrest and to create an atmosphere of understanding and good will.

Company unions (*q.v.*) are another method of dealing with unrest which is open to the employer. These unions generally operate in connection with plans providing for petitions and joint committees to hear complaints but are not so organized as to encourage more vigorous action.

Similar alternatives are open to the state. It may endeavor through protective and other legislation to eliminate abuses and thus to raise the level at which disputes arise. Having done this, it may interfere with the dispute itself by forbidding it, placing limitations upon the methods of conducting it or setting up agencies to promote a peaceable and practical settlement.

Definite limitations, either of custom or of legislation, upon the right to carry labor disputes to the point of striking occur most frequently in the case of public employees and employees of public utilities. Because of legal restrictions public employees resort to political influence or to petition for redress of grievances. Although workers in the civil service are organized in many fields in many countries, strikes of these employees are so rare as to be negligible. In the field of public utilities there are few strikes outside of transportation. This undoubtedly is due in part to the relatively small number of employees engaged at each plant unit, in part to the fact that much of the work is unskilled and substitutes could easily be found, and in part to public opinion, which would generally be hostile to any interruption of service and which if put to the test might favor restrictive legislation. The greater number of workers, many of whom are highly skilled, has led to the growth of trade unionism in the transportation service, and here action in labor disputes has been more aggressive.

The legal status of strikes and methods of dealing with them vary in the different countries. Machinery of some sort for dealing with industrial controversies has been set up in most of the states of the United States. The most common device is a state bureau of mediation and conciliation with no compulsory powers of any sort. In a few states the bureau or some similar agency has power to make an investigation of a dispute and compel witnesses to testify under oath. Only one state, Colorado, attempts to forbid the carrying on of a strike where neither violence nor other illegal methods are involved. In this state no strike or lockout may legally take place while the Industrial Commission is investigating the dispute. This law is an adaptation of a Canadian law applying to public utilities alone.

The United States Department of Labor maintains a conciliation service which attempts to mediate in industrial disputes. The federal law relating to disputes on interstate railroads provides for a board of mediation which may offer its services or suggest arbitration. If its offers are rejected and a strike seems imminent the board must notify the president, who may create an agency to investigate and report. If such an agency is created no strike may legally take place while it is carrying on its investigation or for thirty days after it has reported to the president.

In Great Britain and France as in the United States official machinery exists for the promotion of peaceful settlement of disputes. In Great Britain courts of inquiry may be set up with power to take testimony and make the findings public. In neither country is arbitration compulsory nor are there other legal barriers to peacefully conducted strikes. Germany resorts to compulsory arbitration under certain limited circumstances and it is the established practise in Australia and New Zealand. In Italy all strikes and lockouts are forbidden and in Soviet Russia, although strikes are theoretically legal under certain circumstances, the combined effect of restrictive legislation and the domination of the unions by members of the Communist party has made strikes practically non-existent.

It is during the preliminary stage of industrial disputes while negotiations are pending that governments or other third parties attempt to facilitate settlement by offering their services. Frequently a trade agreement calls for the establishment of an arbitration board whose findings

the groups have agreed in advance to accept. Occasionally two groups without previous arrangement agree to arbitration by the government or by some third party.

Once a dispute has reached the state of an actual strike or lockout, a definite break occurs in the continuity of employment and the two groups assume a somewhat different relation toward each other. The same agencies may still offer themselves or be made available for the settlement of the controversy after it has reached the strike or lockout stage, but the problem has become more difficult by virtue of this changed relation. A new technique—a war technique—is now called into play and the problem of the government becomes one of laying down certain rules, seeing that they are enforced, protecting third parties and attempting as soon as possible to secure a settlement.

LABOR EXCHANGE BANKS is a composite term which for the purposes of this discussion comprises labor exchanges in the older sense, exchange banks and similar experiments and plans. These nineteenth and twentieth century projects were designed to secure a fair compensation for the producer through a currency reform sometimes linked to a reorganization of the mechanism of commodity exchange. The common assumption basic to these plans is that they reject the system of metallic money and the credit structure built upon it as an institution which puts monopolistic power into the hands of the owner of liquid wealth and enables him to exploit the producer who must sell his labor incorporated in commodities. Unlike socialists, who decry the exploitation of the wage-worker by the private owner of the means of production, the advocates of these plans find the root of the evil in the sphere of circulation and credit; their enemy is not the industrialist but the merchant and the banker, and in this sense their outlook is that of the handicraftsman or small manufacturer rather than that of the wage-worker. But they go much further than those who proclaim the parasitism of the middleman; they condemn the existing currency system, which enables him to monopolize money and credit funds rather than the middleman's function as such. The earlier of these plans emphasized the distortion of the true value relationships between commodities caused by the fact that the possessor of money who tries to buy cheap and to sell dear intervenes between the producer and the consumer; they proposed accordingly a more or less direct exchange of commodities against one another with a currency issue designed merely to facilitate such exchange. The later schemes, on the other hand, attacked the charging of interest for loans as the most direct manifestation of exploitation by money and credit power; their primary aim therefore was to bring about such a reconstitution of the currency and credit mechanism as would deprive the moneyed man and the banker of their monopolistic status.

The most important of the early experiments was the National Equitable Labour Exchange established under Robert Owen's guidance in London in September, 1832. The principles underlying it have already been stated in a fairly developed form in Owen's *Report to the County of Lanark of a Plan for Relieving Public Distress* (Glasgow 1821), presented in 1820 when the acute post-war depression in England was being aggravated by measures taken to restore the gold standard. Owen argued that the prevailing poverty could not be due to lack of wealth because man's labor had long been sufficient to maintain him and recent inventions had multiplied its productivity manyfold. The trouble was due to poor circulation of wealth caused by the use of an artificial standard of value—gold and silver—which "altered the *intrinsic* values of all things into *artificial* values" (p. 5). "The natural standard of value is in principle human labour, or the combined manual and mental powers of men called into action" (p. 6), for "that which can create new wealth is of course worth the wealth which it creates" (p. 19). One of the measures required to "let prosperity loose on the country" was an arrangement by which "the *natural* standard of value shall become the *practical* standard of value" (p. 20). This standard obtained under barter when commodities were exchanged against one another according to the amount of labor they contained. But "barter was succeeded by commerce the principle of which is to produce or procure every article at the *lowest*, and to obtain for it in exchange the *highest* amount of labour. To effect this an artificial standard of value was necessary" (p. 20). Like barter commerce was adapted to a certain stage of development—it promoted inventiveness but also encouraged selfishness and greed. With the increase in wealth resulting from inventions metals have become inadequate to represent all wealth; nor can paper money like the Bank of England note be acceptable, because it gives monopoly of the standard of value to a private trading company. Now "the strong hand of necessity" forces man toward a new system which combines the advantages of barter and commerce. Its establishment is conditioned upon ascertaining "the net value of the whole labour contained in any article of value, the material contained in or consumed by the manufacture of the article forming a part of the whole labour" (p. 20) and upon the issue of a paper representative of the value of labor in order to facilitate exchanges. Under this system

"human labour . . . would acquire its natural or intrinsic value, which would increase as science advanced. . . . The demand for human labour would be no longer subject to caprice, nor would the support of human life be made, as at present, a perpetually varying article of commerce, and the working classes made the slaves of an artificial system of wages more cruel in its effects than any slavery ever practised by society" (p. 7). Only under the new system would the producer be certain to receive "a fair and fixed proportion" of all the wealth he creates, to which he is justly entitled and which the best interests of every community require that he should have.

The principles propounded in the *Report* influenced producers' cooperative societies established in the 1820's, which early in their history decided upon the establishment of central exchanges or bazaars to facilitate intercooperative trade at cost prices. An exchange bazaar on "an equitable time valuation basis" was actually founded in April, 1832, by the British Association for Promoting Cooperative Knowledge (the central body of the cooperative movement at the time) before Owen decided to promulgate a full scheme for a labor exchange with draft labor notes and rules. According to this plan the exchange was to receive goods on deposit and to appraise them in terms of hours of labor. The appraisal was to be based largely upon the depositor's own statement, and the cost of raw material entering into the commodity was to be turned into labor time at the rate of sixpence for an hour of labor. A service charge was to be made of a halfpenny per shilling for members and double that for outsiders. The labor notes paid the depositor could then be used by him to purchase goods delivered by other depositors and similarly appraised. Thus, Owen concluded, if a sufficient number of people were to patronize the institution, producers could then exchange their goods without the use of money and the intervention of middlemen.

At the beginning the National Equitable Labour Exchange attracted the interest of the public and met with considerable success. In the first four months goods to the amount of 445,501 labor hours were deposited and goods amounting to 376,166 labor hours were exchanged. No less than 250 stores announced that they would accept the labor notes as the equivalent of cash. It was asserted that a great moral effect had been produced upon the non-laboring classes, who saw the basis of their existence endangered and resolved to seek productive

employment. In December, 1832, the exchange opened a branch in south London and in the following year one in Birmingham. A similar establishment in Liverpool soon followed.

The success of the exchange was, however, short lived. After a while the number of commodities deposited with it diminished and exchanges decreased even faster, the holders of its notes complaining that they could not find the goods which they needed. The exchange accepted goods regardless of the demand for them; its customers took advantage of this to unload goods otherwise unsalable, particularly commodities which required a great deal of labor and a comparatively small use of raw materials. Another fatal practise of the exchange was the setting of equal value upon different kinds of labor; some of the goods in its stocks were therefore priced very low and were eagerly taken by shopkeepers who came into possession of labor notes. The exchange was compelled after a time to make use of money. To relieve the stringent shortage of raw materials in its stocks it solicited subscriptions of money in order to purchase materials for distribution among suitable members; the goods produced according to this plan were to be sold partly for cash and partly for labor notes. A similar arrangement was made with bakeshops to make bread available to the customers of the exchange. These measures, which constituted a radical departure from the principles of the exchange, forecast its early end. The labor note lost 25 percent of its value in the open market and at the end of May, 1834, it was announced that the exchange was to be dissolved.

Owen's experiment was in a sense anticipated by an American, Josiah Warren, who was a member of the New Harmony community in 1825-26. Disappointed in collectivism Warren became an extreme individualist violently opposed to monopolies and to the state created to maintain and perpetuate them. He believed that under true competition price will be equal to cost, while in the present order the upper limit of price is value. Under the value principle prices are raised in consequence of increased want and are lowered with its decrease, and that man is regarded as the most successful who can create the most want in the community; this, according to Warren, is no better than "civilized cannibalism." Under the cost principle price fluctuations, business insecurity, maladaptation of supply to demand and every species of speculation will disappear. Moreover, since the cost

of a commodity is equal to the exertion entailed in its production, goods which do not involve exertion, such as natural resources, will be free. Similarly interest will virtually disappear, as "the equitable compensation for the loan of money is the cost of labor in lending it and receiving it back" (*Equitable Commerce*, 3rd ed. by S. P. Andrews, New York 1852, p. 46). Money shares all the disadvantages of the value system; it is not a proper medium of exchange because its relation to property is indefinite. "Money represents robbery, banking, gambling, swindling, counterfeiting, etc., as much as it represents property. . . . We want a circulating medium that is a definite representative of a definite quantity of property, and nothing but a representative. . . . A note given by each individual for his own labor, estimated by its cost, is perfectly legitimate and competent for all the purposes of a circulating medium. It is based upon the bone and muscle, the manual forces, the talents and resources, the property and property-producing powers of the *whole people*—the soundest of all foundations, and is a circulating medium of the only kind ever to have been issued" (p. 67-68).

Warren's practise was more moderate than his theory. In 1827 he opened in Cincinnati an "equity store" dealing in general merchandise. It sold goods at cost prices, but a charge (4 percent according to some sources and 5 percent according to others) was added to cover general expenses and the time of the storekeeper consumed in waiting upon the customer was paid by the latter in labor notes calling for an equal amount of his own labor; for this reason Warren's establishment became known as the "time store." In addition the store acquired goods for sale on a labor for labor basis, but the labor value of such goods was regulated by the expert opinion in the respective trade and only goods for which there was an assured demand were bought; a list of staple articles with labor values attaching to them was available for ready reference. Apparently not all kinds of labor were given equal value. Warren maintained that "we must discriminate between different kinds of labor, some being more disagreeable, more repugnant, requiring a more costly draft upon our ease or health than others. The idea of cost extends to and embraces this difference" (p. 42-43). For the sake of convenience some labor notes equated labor time to corn at the rate of thirty pounds of grain per hour of the farmer's labor.

The time store was in effect underselling other establishments in Cincinnati and was soon doing a thriving business despite its inconvenient location. But having proved to his satisfaction the workability of the cost principle Warren decided in 1829 to discontinue the store in order to be free for more radical and significant social experimentation. Many of the cooperative settlements which he later founded had equity stores attached to them, and from 1842 to 1844 a similar establishment operated under his guidance in New Harmony. In the meantime some followers of Warren organized in Philadelphia an association of small producers eager for independent marketing facilities; it opened in 1828 a "producers exchange of labour for labour store," which sold goods both for money and for labor, depending upon the manner of their purchase by the store. Two similar stores were established in Philadelphia shortly after the first was successfully launched; later the original labor exchange did business also on a commission basis. It is likewise on record that in 1847 an equity store was opened near Cincinnati by a follower of Warren.

The provision of marketing facilities for the handicraftsmen and small manufacturers who wished to remain independent of capitalist merchants was the need of the hour not only in the United States but also in France. Only thus can be explained the successful operation of a *banque d'échange* in Marseille from 1829 to 1845. Comparatively little is known of this institution established by the brothers Mazel, one of whom, Benjamin Mazel, is known to have been a lawyer influenced by Fourierist and Saint-Simonian ideas and professing a belief that *l'épargne tue, l'échange vivifie*. Although in his *Code social* (Marseille 1843) Mazel proposed that metallic currency be replaced by labor money based on a definite valuation of work performed by each of the seven different classes into which all the producers were to be divided, the bank did not provide for valuation on a labor basis but accepted the prevailing market price as the standard. It allowed its members to deliver goods of their own production, paying for them in exchange notes stated in francs; the notes were redeemable in goods which could be selected and priced in members' shops. A service charge of 8 percent enabled the bank to maintain the necessary quarters and to pay a 5 percent return on the invested capital. Its initial success is illustrated by the fact that about 50,000 laboring families were enlisted

as members and that the turnover for the first six months amounted to 2,400,000 francs. Several million exchange operations in many cities of France, Belgium and Switzerland were effected under the guidance of the bank before it collapsed. The reason for its failure is significant—disputes broke out among members as to the valuation put upon their products and a minority refused to honor the bank's notes. Mazel went to law to force compliance with the agreement. It was decided that a notary public in Lyons should be appointed to appraise the goods of recalcitrant members; he was authorized to compel delivery of goods against the bank's notes and to collect the additional costs which such a procedure involved. Mazel hoped for better luck with the more enlightened artisans of Paris, but the "société générale d'échange" which he planned to establish there in 1848 did not materialize.

The scarcity of money and the lack of equilibrium between production and consumption were the considerations which according to his own admission impelled Bonnard to establish an exchange bank in Marseille in 1849. Bonnard's institution attempted to bring about direct exchanges. Its exchange notes unlike those of Mazel did not represent a general claim against the labor of its members; they merely entitled their holder to certain quantities of specific commodities at a definite valuation. The bank functioned therefore as a clearing house for goods on a commission basis with the administration operating as an expert appraiser. Its success, depending essentially upon the skill with which the appraising was done, was very marked in the early years of its existence. In the first year, for example, it transacted business amounting to 434,624 francs on a capital of 7825 francs and in the following two years it increased both its capital and its business. Another banking practise introduced by Bonnard's institution was the granting of credit in its own exchange notes for the purchase of raw materials, obligating the debtor to surrender the finished product to the bank at a definite valuation. The bank was thus able to finance production from the initial to the last stage in striking contrast to the practise prevalent at the time—the financing by the wholesale distributor from the stage of the finished product downward; it was this aspect of Bonnard's operations which attracted favorable attention of respectable economic opinion, such as represented by Courcelle-Seneuil. In 1853, when Bonnard

reorganized an ordinary exchange bank in Paris into a *crédit central*, he introduced a similar practise there; the turnover of this institution in 1854-55 was reported to be about 45,000,000 francs. The principle was soon adopted by some German credit institutions notably in Magdeburg and Berlin in 1856. In the last years of its existence the management of the Marseille bank apparently neglected the rules of ordinary business prudence; the bank collapsed in 1858 after incurring a loss of 308,000 francs. A fairly large number of banks similar to those of Mazel or Bonnard were established in various cities of France but so far as is known they did not last long.

Although they were never carried out Proudhon's plans for an exchange bank are of greater interest than those of his French contemporaries: they formed an integral part of his general scheme of social reconstruction and had numerous advocates both in his own day and in later periods. Maintaining that the principal cause of poverty and distress is not the anarchy of production but the lack of centralized organization in the field of circulation Proudhon regarded money and interest as the two chief evils which distort true labor values and bring about crises. Both of these could be abolished by a system of mutual credit which would place the exchange of goods and banking on an entirely new basis. The first scheme which he proposed, that of a bank of exchange, was intended to transform the bill of exchange into an instrument of general circulation. The Bank of France, which was to become the only credit institution in the country, was to issue irredeemable *bons d'échange*, the sole circulating medium in France, to be delivered against discounted commercial paper and in the form of loans based on merchandise collateral. Centralization of banking and abolition of redeemability in specie would adjust circulation to the needs of production and dispense with the privilege of moneyed wealth; interest as such would be eliminated and banking charges reduced to the cost of conducting banking operations. Proudhon's second scheme called for the establishment of a people's bank, a voluntary cooperative institution which would grant free credit on a mutual basis and facilitate exchanges through the issue of *bons de circulation* to be delivered to members against goods deposited for sale with the bank. In the valuation of such goods profits were to be renounced and the depositions of members as to cost checked by the bank's appraisers. The

people's bank was established in 1849; 36,000 francs of capital in five-franc shares had been subscribed and a considerable membership both of individuals and of associations enlisted, but the bank had not yet begun operations when Proudhon's imprisonment on a political charge for a term of three years sounded the death knell of the institution.

Proudhon's idea of mutual and gratuitous credit, which he expounded on a number of occasions independently of his concrete proposals, took vigorous hold upon the imagination of his contemporaries. It was reflected, for instance, in Émile de Girardin's scheme of a *banque rationnelle* to guarantee private credit. This service was to be rendered at a much smaller cost to those who agreed to accept the bank's notes in lieu of legal tender, with the obvious intention of setting up a mutual credit scheme alongside the ordinary credit mechanism. The idea of mutual credit proper was popularized in the United States by William B. Greene, a Unitarian preacher of Massachusetts, who published in 1849 a series of articles (reprinted as *Mutual Banking*, West Brookfield, Mass. 1850, and several times thereafter) which attempted to show how the system could be adapted to American conditions. About the same time Charles A. Dana manifested his enthusiasm for the people's bank in a series of articles written for the *New York Tribune* and reprinted during the 1896 presidential campaign by Benjamin R. Tucker (*Proudhon and His "Bank of the People,"* New York 1896), who for many years had advocated mutual banking in the columns of *Liberty* (17 vols., 1881-1908). Mutualism has its exponents to this day both in the United States and elsewhere.

Like Proudhon, Edward Kellogg, a New York merchant who lost his fortune in the panic of 1837, believed that the root of social evil lies in the charging of interest above the actual cost of lending. He looked upon money as a creature of the law and identified the value of money as a medium of exchange with its value as a means of accumulation, i.e. the interest rate. Believing that high interest allows a few large capitalists not only to despoil the producer of his fair share of the product but also to exploit the small capitalist he regarded the prevalence of high interest rates as evidence of capitalistic control of the government. The "true monetary system" which he proposed (*Labor and Other Capital*, New York 1849) would reduce interest to its proper level and provide for a volume of money corre-

sponding to people's needs. Instead of mutual banking he advocated the establishment of a government loan office with branches throughout the country to issue money as loans against mortgages on land; the interest charged, about 1.1 percent, would correspond to the cost of operation and regulate charges in private credit transactions. The quantity of new currency in circulation was to be made flexible by the issue of government bonds yielding about 1 percent which would be interchangeable with the currency. Kellogg hoped that the new system would practically abolish interest, prevent unequal accumulation, dispense with non-productive capital—capital dissociated from the productive effort of its owner—and establish a standard of distribution which would almost conform to the natural rights of man. After his death Kellogg's critique of the existing order and his reform proposal became the economic gospel of the Greenback movement, at least in its early stage when it demanded cheap credit rather than cheap money.

Proudhon's ideas of centralization of exchange and abolition of money influenced Wilhelm Weitling, who in 1851 was the leader of German labor groups in New York City. Weitling advocated the establishment of an exchange which should issue labor money against the deposit of useful articles or the performance of useful work, this money to constitute the sole circulating medium. The labor valuation of the goods was to be determined by a commission collaborating with the associations of producers in each trade, which were to fix wages and guarantee quality. Weitling expected that his plan would not only dispense with middlemen and reduce the cost of exchanging goods but would also stabilize production and abolish unemployment.

The difficulty which none of the early advocates of labor money really attempted to meet was the establishment of value relationships between different kinds of labor. It was faced directly by Karl Rodbertus (in "Der Normal-Arbeitstag" published in 1871, reprinted in his *Schriften*, ed. by Moritz Wirth, 4 vols., Berlin 1899, vol. iv, p. 337-59), who regarded the preservation for the workmen of the benefits resulting from the increasing productivity of labor as a means of stabilizing the social order. He proposed to arrive at a standard unit of labor by establishing for each industry a normal working day, the length of which was to depend upon the physical and nervous exertion required for the particular type of work. The output

of a workman of average skill and application during a normal working day in every industry was to be considered of equal value and to serve as the standard unit of new labor money to be issued by the state and advanced to the employers. In order to secure the general circulation of labor money, which was not intended entirely to displace metallic currency, the output of industry operating under this arrangement was to be assembled in government warehouses for sale against the new money. The advantages of this scheme were the definite determination of wages, regulated by the ratio of actual performance to the standard daily output, and the easy valuation of all commodities. While labor was admittedly the sole producer of wealth it was to get only three tenths of its product; equal shares were to be left for the owners of capital and land, while the remaining one tenth was to be appropriated by the state to cover government expenses. While the standard daily output, functioning as the value unit, was to be revised from time to time in order to take account of the increasing productivity of labor caused by new inventions, labor's share was to remain constant; wages were thus to be protected from the influences forcing them down to the subsistence level.

Attacks upon the iniquities of the monetary and banking system and advocacy of labor money or gratuitous credit were submerged after the triumph of industrial capitalism in the second half of the nineteenth century by the rise of socialism, which became the most important ideology of the oppressed classes. Socialism, which looked upon the struggle between the industrial proletariat and the employers as the major social conflict, had as its goal the revolutionary appropriation to society of the means of production as the only feasible comprehensive solution of the social problem. In its nineteenth century variants it paid little attention to currency and banking as such, tending to view them merely as one of the instrumentalities of the existing order which was as essential to the maintenance of the power of the ruling class as to the normal functioning of the capitalist economy. During the years 1870 to 1914 fierce criticism of the established credit and marketing mechanisms was voiced by small agricultural producers and the surviving handicraft groups, both of which were hampered by lack of capital and by the predatory features of the marketing organization. Their resentment, however, was canalized into bimetallic propaganda, the ad-

vocacy of agrarian protectionism and the fostering, often with government aid, of a great variety of cooperative institutions. Occasionally demands were made for the issue of unlimited quantities of paper money against agricultural or other commodities in storage, but these merely reflected the momentarily depressed condition of some basic industry and were not taken seriously. More socially significant and intellectually substantial plans for currency reform as a means of social reconstruction matured only after the World War, when confidence in orthodox socialism waned and the pre-war mechanism of money and credit showed signs of collapse.

Perhaps the most interesting of these proposals is that advanced by Major C. H. Douglas, a Scottish engineer. Douglas contends that at present the economic organism is dominated by bankers, who have succeeded in usurping the privilege of creating purchasing power and therefore of making prices. According to Douglas every new productive process means the creation by the banks of more purchasing power, which after a time they must somehow retrieve and cancel. This can be done only if the prices of finished goods are raised high enough to absorb, when sold to ultimate consumers, the entire amount of purchasing power created by the banks, even though a part of it has been used to finance the manufacture of intermediate goods, not transferred to consumers. For this reason manufacturers are driven to raise prices by every means possible—by reducing production of consumers' goods at the expense of producers' goods, by expanding exports and by forming monopolistic combinations. This system of financial accounting, which is out of accord with the real situation, can be dispensed with only if prices are regulated so as to allow for the retention in the hands of the community of an amount of purchasing power corresponding to the increase in real capital. Prices must be set at a fraction of costs as calculated by the manufacturer, a fraction corresponding to the ratio of the cost value of total consumption (including capital depreciation and exports) to the money value of total production (including capital appreciation and imports). To reimburse the manufacturer, who will thus have to sell below cost, a national authority must create a sufficient amount of new purchasing power to balance the accretions to real capital. The essential condition for the execution of this reform is the restoration to the community of the banking function; that is, the ability to create financial evidences of

purchasing power. In each industry a bank owned by organized labor should be established through which the employers will disburse wages, salaries and dividends and the government credit the manufacturers with the difference between cost and prices. Once this is accomplished, the artificial limitation of production of consumers' goods will be relaxed, industrial efficiency will approach in practise its theoretical limits and production in general will be oriented in the interests of the consumer. The Douglas scheme of social credit, which is supported in England by the London weekly *New Age*, has attracted attention in recent years also in the United States but is practically unknown on the continent.

The foremost currency panacea on the continent is that proposed by Silvio Gesell, who advocates "shrinking" or free money. Gesell explains the exploitation of producers and the periodic breakdown of the distribution machinery by the inequality of the terms on which the owners of goods and the owners of money meet in the market: while most goods are apt to depreciate if they remain unused, money is an imperishable value. To restore the balance a new currency must be introduced which will impel its holder to exchange it for goods as soon as possible. Gesell maintains that the purpose would be answered by paper money which would depreciate every week by 0.1 percent. It would accelerate exchanges and reduce their cost as well as eliminate interest. Of necessity a managed currency, its issue could be administered in such a way as to keep the price level stable. Gesell's unhoardable currency was actually tested in 1931 in Schwanenkirchen, a German industrial community; the experiment, conducted on a small scale, proved successful.

The German National-Socialist (Nazi) Labor party has its own scheme of economic reconstruction, the central feature of which is the abolition of "interest serfdom" by means of a currency reform. According to its economist Gottfried Feder the party is opposed not to capitalism but to its distortion, "mammonism," characterized by the hegemony of loan capital, which thrives by imposing upon the productive classes the burden of interest charges. There is no reason why the ownership of money pure and simple should yield a continuous income nor is there any ethical justification for it. The community is the source of all money and credit, and it is particularly irrational for the state to follow the methods of ordinary business and

borrow money at interest from private creditors. In connection with a housing scheme Feder advocates the establishment of banks which shall issue notes or book credits lent free of interest to the owners of the land for use in building construction. The banks are to be repaid within fifty years, during which period the currency thus injected into circulation will be gradually withdrawn.

It is too easy to condemn the post-war proposals or the earlier plans in the light of orthodox economic analysis; the obvious confusions involved are those of the labor cost of production with value which is vitally affected by demand factors and of money with capital or of short term credit to finance self-liquidating transactions with long term credit supposed to come from savings. Such criticism is relevant, however, only in so far as the assumptions underlying orthodox analysis are in perfect correspondence with economic reality, and it is futile because the denial of the validity of these assumptions is basic to the reasoning underlying the proposals. Much more relevant is the consideration that the plans do not go far enough. Most of them aim at a radical reconstitution of the circulating mechanism without infringing upon the individualistic and decentralized set up in the sphere of production; therein lies the principal logical fallacy and the most unyielding obstacle to their practical execution. The centralized regulation of the exchange of goods, such as is implied in authoritarian valuation, must involve regimentation of both consumption and production, while the abolition of interest, however accomplished, signifies the expropriation of the capitalist and a most radical revision of the relations between the various factors of production. In the present stage of capitalism the reform of currency and banking must form an essential part of any program of revolutionary reorganization, but it would be only a part integrally related to changes in the other components of the existing order.

LABOR EXCHANGES. *See* EMPLOYMENT EXCHANGES.

LABOR, GOVERNMENT SERVICES FOR.

Government services for labor comprise legislative provisions and administrative activities designed to regulate and improve the conditions of labor. These services are essentially a product of the modern industrial system. The rudimentary labor legislation which existed among most of the peoples of antiquity is not comparable to the elaborate government services for labor which have developed and are growing more comprehensive and complex in modern industrial countries. The services vary in character and scope from country to country, but in general they are most highly developed in the more industrialized countries, where wealth is greatest and labor has achieved significant status.

With few exceptions the welfare of labor did not receive much consideration before the nineteenth century. Most labor, except that of killing enemies, was held in contempt and was performed by slaves or serfs who had the status of cattle and enjoyed little or no governmental protection against their owners or masters. A few of the peoples of antiquity, however, developed laws and customs regulating working conditions. The laws of Hammurabi fixed the wages of laborers and limited the freedom of both workers and masters. The labor regulations embodied in the Mosaic law reproduce the more ancient laws and customs evolved by the Semitic peoples of Babylon and other eastern countries. Some principles in the codes of these ancient oligarchic and despotic states reappear in modernized form in the democratic states of today; thus the Sabbath, prescribed on theological grounds in the Mosaic code, is now considered not as a pious acceptance of the precedent established by a work weary Jehovah but as a necessity for health, efficiency, sound morals and good citizenship. When agriculture became unprofitable in Roman Italy the government passed laws improving the status of the slave tillers of the soil and facilitated transition to a sort of serfdom. Although in mediaeval Europe the church considered charity a duty, it can scarcely be said that there were any government services for labor in the modern sense. Mercantilism projected a series of government services for industry and commerce but practically none for labor. It can be broadly stated that until the beginning of the nineteenth century government regulation of labor conditions was designed to keep laborers in their place, to compel them to work for such wages and hours and under such conditions as their masters chose to offer. The Statutes of Labourers in fourteenth century England tried to keep down wages and prevent combinations of workers. Somewhat similar laws to offset demands for "excessive pay" were adopted in the North American colonies. Suppression not protection of the rights and welfare of workers was the predominating motive of the ruling classes; it still is to a large extent, but the motive of suppression is limited and modified by the increasing economic and political power of labor.

Government services for labor in their modern purposes and complexity are a direct result of forces set in motion and changes produced by the industrial revolution. No systematic or continuous development of labor legislation was

possible until modern industry had so altered social organization as to make possible the assertion of labor's needs and rights and their recognition as an aspect of the general social welfare. The first impetus to the development of government services for labor came from recognition of the abuses and degenerating influences of the early factory system, particularly the danger to the community incident in the exploitation of women and children and in certain occupational diseases. Humanitarians and social reformers insisted on the necessity of enforcing minimum standards for the good of the enlightened community, and others argued that the "future of the race" (often interpreted as its ability to provide efficient soldiers) was threatened by unrestrained industrialism. The steady increase in the number of industrial wage-workers and their organization into unions and labor parties have in some cases enormously strengthened the pressure for legislation and other government services for labor. Thus the elaborate labor legislation of Bismarckian Germany had as one of its main purposes the prevention of the spread of socialism, and this was equally true of the rudimentary labor legislation which arose in Russia prior to the World War. Another contributing factor was the idea that better working conditions meant higher productivity of labor; in fact labor standards were sometimes raised in order to assure the victory of the employer with a modern production technique over his backward competitors.

Modern humanitarian labor legislation in contrast to former merely repressive laws began in England with the Health and Morals of Apprentices Act of 1802, an act to regulate the conditions of child labor. The act itself produced little change in factory conditions because no adequate administrative machinery was provided, enforcement being placed, as in the case of the Elizabethan poor laws, in the hands of justices of the peace, who generally ignored the law. It took more than twenty years of agitation to prohibit children under nine from working in cotton factories and to limit the work of children between nine and sixteen to twelve hours per day and sixty-nine hours per week, exclusive of meal times. Reports of investigating commissions indicate that outside the regulated cotton factories physical weakness and exhaustion set the only limits upon the age and hours of employment recognized by many employers. Early legislation and its enforcement met with determined opposition from employers and their

sympathizers; John Bright, for example, threatened to close his works if the state interfered between him and his workers. But the principle of state interference in industry for the protection of workers as an important measure of social welfare was firmly established by the early factory acts. From these small beginnings have grown the general recognition of the necessity of public regulation of private employment, the extensive systems of laws, court decisions, administrative regulations and enforcement agencies for the regulation of employment relations, and other government labor services developed in Great Britain and the British Empire.

Outside the British Empire the development of government labor services has been very uneven. In general they have expanded with the development of industry, the labor movement and democracy. Economically backward countries, where the rising factory system usually duplicates many of the worst features of the earlier industrialism in England, offer few services to labor. Even the United States, highly industrialized and democratic, has lagged behind England and Germany in government services for labor, although government services for industry and commerce have developed on a large scale. This lag can be explained only in part by the existence of vast undeveloped resources, the great opportunities offered ambitious individuals to rise out of the working class and the consequent fluidity of classes, for these conditions existed also in New Zealand and Australia, where government services for labor far surpass those of other countries. Other causes are comparatively high wages, the strength of American capitalism and its resistance to social legislation, the peculiar heritage of an extreme individualism, relative lack of interest in social legislation on the part of the labor movement and the development of "welfare capitalism" in large scale industrial enterprises.

The order of evolution of the various government labor services in different countries has also varied considerably. The typical chronological sequence has been as follows: prohibition of child labor in certain employments and regulation of hours of labor for both children and women; establishment of sanitary and safety standards; creation of factory inspection and special commissions to investigate conditions of labor; provision for conciliation and arbitration of industrial disputes; provision of compensation for disabilities due to work accidents and sickness; machinery for fixing minimum

wage rates; establishment of state health (sickness) insurance and old age pensions; provision for compulsory unemployment insurance; governmental endeavors to promote better employer-worker relations by setting up machinery for the participation of workers in the management of industry. In some countries these services appear in isolated, often unrelated forms; in others they consist of comprehensive, unified systems of social legislation and the necessary administrative machinery.

In the development of government labor services laws regulating the work of women and children were followed shortly by legislation establishing standards of shop sanitation, ventilation, lighting and protection against dangerous machines and work places. The difficulty of setting up safety standards by legislative enactment has led most governments to the expedient of authorizing administrative agencies to work out safety codes to deal with particular hazards in each industry. In the United States greater emphasis has been given to the development of safety codes than in other countries because the industrial accident rates have been so alarmingly high. The National Safety Council, an employers' organization, has cooperated with state labor officials in perfecting safety codes for nearly all industrial undertakings.

The passage of labor legislation led to the organization of administrative agencies designed to execute the will of the legislatures as interpreted by courts or administrative officials. The Factory Act of 1833 in England created a system of factory inspection to enforce the factory laws, which had theretofore remained in many instances merely dead letters. Since then practically every country having any considerable industrial development and labor legislation has provided some administrative agencies, but their adequacy differs widely from country to country. The best inspection systems and the best trained inspectors are to be found in the industrial nations of Europe; English factory inspectors and investigating commissions in particular have earned an enviable reputation for efficiency and devotion to duty. Many economically backward and some highly advanced countries which can boast of comprehensive and progressive protective labor laws have failed to provide adequate and efficient means of enforcement. China, for example, has passed legislation embodying the provisions of the draft conventions adopted by the International Labor Conference respecting limitation of

hours of work, vacation with pay for women at childbirth, prohibition of the labor of children below the minimum age, prohibition of night work of young persons and the prohibition of the use of white phosphorus in match manufacturing. No enforcement machinery exists, however, and the laws are scarcely more than moral yearnings inscribed on the statute books. It is asserted that this failure is due to the constant and continuing turmoil which has prevented the establishment of any effective national government since the establishment of the republic. Mexico also has an extremely progressive system of social legislation which is not rigorously enforced, although in comparison with prerevolutionary days labor services there are considerable. In most of the other Latin American countries labor services have grown markedly since the World War under the influence of increasing industrialization, of a growing labor movement and, to a certain extent, of the International Labor Organization, all of which are encouraging new ideas of state regulation of labor conditions. Nevertheless, labor legislation is still meager and rarely enforced. Among the most advanced industrial countries the United States offers many conspicuous examples of government labor agencies which lag far behind the enactment of labor laws. A great variety of labor laws or a total lack of them and every degree of adequacy or inadequacy in enforcement may be found in the forty-eight states of the union.

The development of government labor services with their emphasis on social and class cooperation led naturally to state action for the prevention or settlement of industrial disputes, which increased in intensity and magnitude with the growth of industrialism. Spectacular outbreaks of "peaceful" industrial war because of their dramatic features attract much more public notice than unemployment, sickness and accidents. Pressure for state interference in industrial disputes came from both capital and labor, although not always simultaneously and with the same purposes in view. Most western countries now have agencies to aid employers and employees to adjust their differences without resort to strikes or lockouts and to resume employment relations in cases of open rupture.

Great Britain has evolved through long experience a comprehensive system of non-compulsory conciliation and arbitration. Only briefly during the World War did the United Kingdom depart from its traditional policy of free agree-

ments and resort to compulsory arbitration, but the failure of compulsion to compel caused it to be dropped as soon as the war emergency ended. No large claims, however, can be made for the success of the non-compulsory British system. Many governments have enacted drastic laws forbidding strikes and lockouts entirely or until after public investigation and report. New Zealand was the first country to try to bring agreement by compulsion; in 1894 it enacted a compulsory conciliation and arbitration law applying to public utilities and certain essential industries, under which the rates fixed by the arbitration tribunal were binding upon both employer and employee. The fundamental principles of the New Zealand law were adopted by the Australian states (except Victoria and Tasmania) and the Commonwealth of Australia. For twelve years subsequent to the enactment of compulsory arbitration New Zealand was known as "the land without strikes," but since 1906 strikes have been about as frequent as in other countries with similar industrial conditions. Canada has tried to prevent strikes with the Industrial Disputes Investigation Act of 1907, which has since been amended; the act provides that no strikes or lockouts are allowed before the board of inquiry set up by the Department of Labor has investigated the causes of the dispute and made a report thereon. Neither party is obliged to accept the decision of the public investigators, and in fact even outlawed strikes have been merely reduced in number rather than completely eliminated.

Germany has built up what is perhaps the most elaborate and comprehensive system for conciliation and adjudication of labor disputes. The Industrial Courts Act of 1890 created permanent courts for deciding labor disputes, in which employers and workers are equally represented. Since the World War the authority of these courts and their conciliation machinery has been greatly extended by making them responsible for the interpretation and enforcement of collective agreements. Germany's conciliation system has developed into a compulsory arbitration system with compulsory enforcement of awards. In 1926 the Reichstag created a unique system of labor courts for adjudicating labor disputes; with much broader powers than the courts created in 1890 these courts have exclusive jurisdiction in all labor cases and are entirely independent of the ordinary courts. The labor court system comprises local labor courts, district labor courts and a federal labor court,

as the court of last resort; courts in a particular state are under that state's jurisdiction.

In the United States attempts to prevent strikes were made by Colorado with a State Industrial Commission based on the Canadian legislation and by Kansas with a Court of Industrial Relations, which were to investigate and act on labor disputes. Both measures met with the hostility of capital and organized labor (especially the latter) and failed to prevent strikes. Many states have some sort of governmental machinery for conciliation and arbitration. The federal government has had an industrial conciliation service, started in 1888 but not given any real functions until 1913, the main function of which is investigation; it has a small personnel and is not equipped either legislatively or administratively to accomplish any very important work. Another federal conciliation service is the Board of Mediation, which functions exclusively among the railroads and is supplemented by the authority of the Interstate Commerce Commission to regulate conditions of work and safety.

The conciliation machinery set up by governments has helped to adjust labor disputes as well as to prevent their occurrence in many cases. Compulsory laws seem to have accomplished little, however, except to send some workers to jail and to increase rancor and opposition to governmental interference. Government interference in labor disputes usually redounds to the benefit of the employers, since governments are mainly interested in preserving the status quo, which labor strives to upset more frequently than capital, and act in the name of "the public," which desires industrial peace—at practically any price. Government interference in labor disputes appears in its most drastic form in Fascist Italy and Communist Russia, where strikes are unconditionally forbidden. Both have severely regulated employment and have practically destroyed independent action by laborers who singly or collectively might seek to achieve advantages at the expense of other groups.

An outgrowth of the government service involved in labor conciliation, mediation and arbitration is the movement for state action to promote the "participation of labor in management." The movement originated in the United Kingdom during the World War, when radical shop stewards in some plants repudiated collective agreements made for the whole nation, even though the officers of their own trade unions had negotiated them. To counteract this rebellion

and to promote organization in unorganized industries the Whitley councils consisting of representatives of employers and workers were set up by legislation. There are a national joint council for each industry, district joint councils and a local works committee in each plant. Their purpose is to give workers frequent opportunities to air their grievances and to discuss any matters of shop management with managers and employers. It is claimed that the councils have brought about a better understanding between employers and workers and a higher morale in industry, but proof is lacking or uncertain. Few Whitley councils would have been formed without the strenuous efforts of the government and still fewer would have survived. The same meager success met the somewhat similar works councils in Germany, an extremely elaborate system set up by the government to give labor a "share" in management. These attempts are not strictly governmental labor services but they are animated by the same general motive—better understanding, cooperation and peace between labor and capital.

Among the more important government labor services are benefits for or insurance against sickness. The fact that more physical suffering and economic distress are caused by illness than by accident disabilities was recognized in some districts and industries in Germany and Austria, where sick benefits were established with government sanction even before accident benefits were first inaugurated. The detrimental effects of sickness, accidents, invalidity and old age upon workers impelled Germany to adopt in 1883 the famous Social Insurance Act, which obliged employers in most industries to organize mutual associations to insure workers against disabilities from these causes. The money benefits provided were small, but the act clearly recognized the principle of public responsibility to workers incapacitated for work by any cause. Austria passed similar legislation in 1888 and other European countries soon followed—Hungary in 1891, Norway in 1909 and England in 1911. Today the principle of compulsory general health (sickness) insurance is recognized in all advanced European countries, but in only two countries outside of Europe—Chile and Japan. There is no insurance against illness in the United States or Canada, although European experience has amply demonstrated that illness is an insurable hazard and that the administration of health insurance is little if any more difficult than that for accident compensation.

Not until 1897 did the United Kingdom adopt a compensation law, thus discarding the three atrocious common law doctrines of fellow servant, contributory negligence and assumption of risk, which made it practically impossible for a worker to collect damages from his employer for work injuries. Most advanced industrial countries now have legislation providing for work accident compensation, although the laws differ widely in content. In the United States, for example, all but four of the forty-eight states have some kind of workmen's compensation law, but no two laws agree completely on any one point. In some instances identical language in the laws of two or more states has been so interpreted by the state courts as to make the identical provisions quite dissimilar in effect. The workers in only five states and in the federal service receive compensation for industrial diseases; four other states grant compensation for certain listed diseases only. The United States and Canada, although they lag in other government labor services, have the most advanced types of law and administration in workmen's accident compensation.

That labor legislation originates in attempts to protect the most helpless and exploited groups of workers is evidenced again in the development of legislation for setting minimum wages. Minimum wage legislation was first enacted in Victoria, Australia, in 1896 to protect workers in "sweated trades." The principle, which applied from the beginning to male as well as female workers, has been accepted in all the Australian states and in New Zealand. The setting of wage rates, even minimum rates for women and children, was long fought by workers and employers alike as an undesirable or unwarranted interference with employment. It is still opposed by most American trade unionists on the ground that a minimum wage is set at the minimum of subsistence level and that the minimum so fixed becomes the maximum. The United Kingdom adopted the principle in 1909 as applying to women workers in certain "sweated" trades where wages were exceptionally low but has since extended it to cover men and women in practically all unorganized or weakly organized trades. The Trade Board acts provide for the fixing of minimum wages by representatives of employers and employees. These acts effectively repeal the ancient English common law principle known as freedom of contract, which safeguarded the "right" of an employee to contract "freely" with his employer for such wages as the employer

was able to impose. The minimum wage is obligatory; an employer accused of paying less than the minimum wage fixed by a board may be sued by his employees or by the officials of the Ministry of Labour and if found guilty is subject to fine as well as to the payment of all withheld wages to his employees. The principle of minimum wage rates is well established and is accepted in practically all European countries; in the United States its application has been brief and unimportant. In practise the rates fixed are usually below the level of "health and decency," but they recognize the standards of existence which obtain in the given trade. The International Labor Office has given much consideration to the minimum wage problem and has recommended that a minimum wage draft convention be adopted by the Labor Conference.

Unemployment insurance appears to be an inevitable corollary and a logical culmination of government labor services. Unemployment relief funds were first established by trade unions. Today unemployment prevention and relief are recognized in Europe as the most important services the government owes to workers. Seventeen European countries and Queensland, Australia, have adopted unemployment insurance systems. If the Wisconsin system of unemployment reserves be included, eighteen jurisdictions throughout the world have provided unemployment insurance, representing nine compulsory and nine voluntary systems. The United Kingdom established in 1911 the first nation wide system of unemployment insurance, based on an efficient network of employment exchanges for the entire country organized under the Labour Exchange Act of 1909. In 1920 unemployment insurance was extended to all workers except those engaged in agriculture, domestic service and casual labor. An important incidental service provided by this act is a practically complete registration of all unemployed persons. Since the war unemployment benefits have been extended to meet the unemployment and poverty caused by economic depression.

Among the important and best developed activities of government labor bureaus is the compilation of statistics and the preparation of reports dealing with conditions relating to labor. This service, performed for the benefit of employers and employees alike, dates from about the middle of the nineteenth century; now all but the most backward countries publish more or less satisfactory labor statistics. The information includes statistics of wage rates, earn-

ings, hours of work, cost of living, employment and unemployment, strikes and lockouts, industrial accidents, workmen's compensation and other subjects connected with employment. The publications of the United States Bureau of Labor Statistics and of some of the state bureaus are among the most complete except for the lack of unemployment statistics; Canada, the United Kingdom, Germany, Australia and New Zealand compile very full and useful information. In addition to regular statistical reports the information includes special investigations and reports on various aspects of labor in industry. This service would be much more useful were statistical aims and methods standardized internationally. It is impossible to make accurate comparisons of such a relatively simple matter as the rate of fatal accidents in mines and factories in different countries, while in the field of earnings and cost of living only rough guesses as to relative levels and rates of change are possible. The International Labor Office is trying to bring about some degree of standardization, but it will be many years before the fixed traditions and practises in the various statistical offices can be modified so as to yield comparable labor statistics.

Along with variations in the scope and complexity of government labor services in the different countries there are great differences in the administrative organization of the services. The range is from wholly inadequate administrative machinery in such countries as China to the elaborate and efficient ministries of labor and other agencies in the United Kingdom, Germany, Belgium, France and other advanced industrial countries.

The United Kingdom, which in 1931-32 appropriated £119,000,000 on its labor and social services out of the central government's total appropriations of £865,000,000, has a well organized Ministry of Labour. This ministry, created in 1917, has three departments particularly concerned with labor services: the industrial relations department; the general department, comprising the trade boards division, the statistics division and the International Labor Office division; and the employment and insurance department. The industrial relations department administers the Conciliation Act of 1896 and the Industrial Courts Act of 1916, which provide for the prevention and the settlement of trade disputes of all kinds. The Whitley councils are organized under this department. In the general department the trade boards division administers the Trade Board acts, which

provide for the establishment and enforcement of minimum wage rates in unorganized trades; the statistics division gathers and compiles excellent reports on employment, wages, hours and conditions of labor, cost of living, strikes and lockouts, trade unions, employers' associations and other important subjects relating to workers; the International Labor Office division serves as the liaison office between the British government and the International Labor Office and has representatives from the Home Office, the Board of Trade, the Treasury, the Foreign Office, the Colonial Office and the Ministry of Agriculture. The employment and insurance department administers the Employment Exchanges and the Unemployment Insurance acts. The ministry has approximately 1160 local offices grouped in seven major divisions. In addition to the Ministry of Labour various other ministries and departments are entrusted with the administration of various labor laws. Factory inspection is carried on by the Home Office; the Health Insurance Act is administered by the Ministry of Health; the Ministry of Transport looks after the hours and conditions of work of railway employees; the mines department in the Board of Trade looks after the health, safety, wages, hours and conditions of workers in mines; while other ministries perform services to labor in particular industries.

In spite of the disorganization and poverty caused by the World War Germany has clung to her historic policy of protective labor legislation, and the German Ministry of Labor created in 1918 is perhaps the most comprehensively organized labor service agency to be found anywhere, with the possible exception of Soviet Russia. It consists of six divisions dealing with general policies; social insurance; labor law, labor protection, wages and social questions; employment exchanges, unemployment insurance and relief; with welfare services, comprising social relief, housing and land settlement; and with pension law. There are also seven subdivisions and fifty-four sections. In 1929 its expenditures amounted to 723,367,000 marks. France has had since 1906 a Ministry of Labor, Hygiene, Assistance, and Social Welfare, which is now divided into four directorates subdivided into fourteen bureaux. In addition there are three services dealing with actuarial matters, statistics and private insurance societies, and a large number of councils and commissions. Most types of labor service are covered, including labor exchanges, unemployment, regulation of labor and

wages, industrial hygiene and safety and housing. It expanded its functions and improved its administrative apparatus after the passage of the social insurance law in 1928, although each insurance fund is managed by an autonomous body with the council of administration elected at a general meeting of insured persons. In addition there is in France a national labor supply council, created in 1920 and attached to the prime minister's office in 1925, which coordinates the work of employment exchanges and regulates the influx of foreign and colonial labor. In Italy since 1923 services to labor have been placed in the Ministry of National Economy, which includes a general directorate of labor and social welfare, national social insurance fund, national industrial accident fund, control statistical office, general inspectorate of industry, general directorate of agriculture, general inspectorate of mines and national fuels, general inspectorate of industrial education and some other services affecting labor. The corporations into which workers and employers are organized in each major industry carry out the policies determined by the central government. A peculiar government labor service in Italy is the *Dopolavoro*, which is similar to the American Young Men's Christian Association. It was originally a private enterprise but it now functions as an organ of the Fascist state.

The scope of government labor services is more comprehensive in the Soviet Union than in any other country, although the administration is as yet imperfect. This flows from the theory and structure of the Soviet state, which makes its primary concern the welfare of labor. Legislation and other government labor services consequently are designed to cover every need and risk of industrial and agricultural workers. The All-Union Commissariat of Labor is supplemented by similar commissariats in each of the constituent republics. Within these commissariats are bureaus of labor protection which supervise the safeguarding of workers in conjunction with provincial and local administrative organs; the work although centralized provides for a large measure of local autonomy. The unions participate in labor protection through the factory committees on labor protection, which work in conjunction with the inspectors. Measures of labor protection are based on the theoretical material furnished by over eighty institutes engaged in research on working conditions and by factory research departments and independent institutes. Another department of

the Commissariat of Labor is the Bureau of Central Administration of Social Insurance. Social insurance in the Soviet Union includes all workers and all forms of insurance—sickness, invalidism and disability (full pay), old age and maternity (full wages for the working mother two months before and after childbirth, nine months' maintenance allowance for the child). No unemployment insurance is provided since there is presumably no unemployment. The collections and expenditures of insurance funds are under control of the labor unions. Total expenditures on labor protection and social insurance in 1931 amounted to 2,500,000,000 rubles. The Commissariat of Health spent another 1,271,000,000 rubles on public health (including health work in factories).

The administrative machinery of the government labor services is not very highly developed in the United States, where social legislation in general is backward. After the Civil War trade unions and labor leaders demanded government bureaus devoted to the interests of labor. The first government labor agency was the Massachusetts Bureau of the Statistics of Labor, formed in 1869; fourteen states created similar bureaus before the federal government created the Bureau of Labor in the Department of the Interior in 1885. Shortly thereafter the Knights of Labor demanded a department of labor; this was created in 1888 and absorbed in 1903 by the Department of Commerce, which became the Department of Commerce and Labor. The present United States Department of Labor was established in 1913 to "foster, promote and develop the welfare of the wage-earners, to improve their working conditions and to advance their opportunities for profitable employment." It consists of the Bureau of Labor Statistics, which makes statistical reports upon hours, wages, productivity and conditions of labor, wholesale prices, retail prices and cost of living, industrial accidents and hygiene, workmen's compensation and other important subjects; the Bureau of Immigration and the Bureau of Naturalization; the Children's Bureau, which deals with child welfare in general as well as employment, wages, hours and conditions of child workers; the Women's Bureau, which makes special studies relating to the employment of women; the Employment Service, which continues to operate in a much curtailed and ineffective manner a national system of employment offices in conjunction with the several states; and the Division of Conciliation, which attempts to medi-

ate and settle certain important labor disputes when invited to do so. The department is handicapped by lack of authority, the backward state of labor legislation and labor services generally, and inadequate financial resources. It has about 4908 officials and employees, and its appropriation in 1929-30 amounted to \$11,322,000 and in 1932-33 to \$12,920,770.

Many important services to labor are performed by other federal departments. In the Department of the Interior the Bureau of Mines, created in 1910, has charge of safety work and the reporting of mine and quarry accidents; the Bureau of Navigation supervises the employment of seamen. In the Treasury Department the Bureau of the Public Health Service makes studies of occupational diseases and fatigue in relation to lost time and per capita production; the Interstate Commerce Commission exercises jurisdiction over wages, hours and conditions of railroad labor and accidents; the United States Employees' Compensation Commission handles industrial accident compensation cases for all federal employees and all employees and employers in the District of Columbia; the Federal Board for Vocational Education, created to promote vocational education in cooperation with the several states, also administers the expenditure of federal funds provided to supplement state appropriations for the rehabilitation of persons disabled in war and in industry.

The administrative machinery of government services is also backward in most of the states of the American union. The early American state labor departments were agencies for investigating and studying labor conditions and making recommendations to the legislatures. At present the labor departments in most of the states are responsible for enforcing the labor laws; many also have quasi-legislative powers in connection with safety legislation and quasi-judicial powers under workmen's compensation acts. The departments generally administer some laws which are not properly labor legislation and have some duties not connected with labor problems. A few departments are not charged with enforcement of the labor laws. In about a dozen states there are separate labor and compensation departments. Nearly all the labor departments are understaffed and their functions are usually performed less efficiently than in England or Germany. In 1929 the total expenditures on labor administrations of all the states did not exceed \$6,539,000 (exclusive of workmen's compensation administration), of which \$3,355,000

was expended by three states—New York, Pennsylvania and Illinois. Florida has no labor bureau and its only labor official is a factory inspector; the same holds true of Mississippi, and New Mexico has only a coal mine inspector. Some states have no factory inspection and some have no inspection of mines and quarries. In most of the states labor protection suffers because inspectors are not required to pass civil service examinations to prove their competence and are not systematically trained in the duties and technique of the service. Massachusetts, New York, Ohio and Pennsylvania have highly organized departments of labor. The New York department, which may be taken as the model, is divided into seven sections: a bureau of inspection, which is responsible for enforcement of laws and prosecution of violations; a division of industrial codes, which holds hearings and investigations preparatory to the formulation of new codes; an engineering division, which examines and approves plans for public, industrial and commercial buildings; bureaus of industrial hygiene, of women in industry, of statistics and information and of industrial relations (mediation and arbitration). It also operates public employment offices in various cities. In general the most highly organized service in the United States and also in Canada is the administration of workmen's compensation. A unique quasi-official organization, the International Association of Industrial Accident Boards and Commissions of the United States and Canada, has been formed to establish and better standards of administration and to improve the compensation laws of both countries. The Association of Government Labor Officials of the United States and Canada has similar functions in the broader field of general labor administration.

The growth and increasing complexity of government labor services make larger and larger demands upon the personnel employed to maintain the services, creating a large body of experts with a knowledge of economics, technology and psychology. The character and ability of the personnel naturally differ from country to country; in general they are lowest in the backward countries and the newer industrial nations and highest in Europe, with the United States occupying a middle position. Jobs in the American services are frequently dispensed as patronage to politicians and labor leaders who are presumed to influence the workers' votes; these conditions are, however, slowly changing, and a body of experts is being developed partic-

ularly in the labor services of the federal government. In the advanced European countries the character and ability of the experts in the government labor services are extremely high; the requirements are stringent and the work is considered a life profession. Factory inspectors, for example, must pass severe examinations which necessitate arduous preliminary study and training. Political appointments are rare, tenure is secure during good behavior and promotion determined by competence and service. Because of the introduction of an international civil service system high standards prevail also among the expert personnel of the International Labor Organization; this has had an important influence on raising personnel standards in the labor services of the more backward countries.

The International Labor Office marks the culmination of decades of effort for common international action on the improvement of labor conditions. In the twelve years of its existence the International Labor Organization has been of great service in directing attention to substandard conditions of labor in many countries and in fostering public opinion favorable to higher standards. The importance of the International Labor Organization services to labor should not be judged by the number of draft conventions adopted by the labor conferences, the number of ratifications by governments and the number of new laws passed to carry these conventions into effect. Of much greater significance is the education of public opinion in all countries to the importance of the standardization of labor legislation, improvement in the quality of labor administration and the necessity of strengthening both the national and international services which governments may perform for labor.

LABOR INJUNCTION. The use of the injunction in industrial controversies gives as striking an illustration as the law affords of the truth that in the domain of ideas, no less than in the biological world, an organism cannot be torn from the context of its environment without destroying its meaning. Abstractly the labor injunction is merely the application of a generalized legal idea to particular circumstances. But these introduce social and economic factors which give the injunction a unique setting and create for it an essentially new situation.

The injunction is the powerful and staple device of the equity side of Anglo-American legal administration. The first authoritative resort to this remedy in a controversy between employer and employees was made by an English court. But the innovation did not take root in its native soil. Until its recent formal revival in England the labor injunction remained distinctively United States law. As in other fields of social endeavor similar concepts have, however, penetrated also into Canada. While as late as 1896 the chief justice of Massachusetts could say in opposing a labor injunction sanctioned by his court that the "practice of issuing injunctions in cases of this kind is of very recent origin" [*Vegeahn v. Guntner*, 167 Mass. 92, 100 (1896)], the idea once transplanted to America has burgeoned exuberantly.

An English vice chancellor in 1868 restrained striking employees "from printing or publishing any placards . . . whereby the property of the Plaintiffs, or their business might be damnified" [*Springhead Spinning Co. v. Riley* (1868) L. R. 6 Eq. 551]. This precedent was not followed by the English courts, indeed was criticized. So far as it looked to law England continued to rely upon criminal law for the maintenance of industrial peace. After the famous Taff Vale judgment, whereby union funds could be reached for wrongful acts by union members in the course of a strike, the Trade Disputes Act of 1906 in order, as Vinogradoff has said, "to allow organized labour to exert its action as a counterpoise to the power of capital wielded by the employers" (*Collected Papers*, ed. by H. Fisher, 2 vols., Oxford 1928, vol. ii, p. 323) gave unions complete immunity "in respect of any tortious act." The general strike of 1926 caused Parliament in 1927 to restrict the immunities of the act of 1906 to cases only of "legal" strike—illegal strikes being defined as those whose purpose was other than to further a trade dispute or those designed to exert pressure upon the government [Trade Disputes and Trade Unions' Act, 17 & 18 Geo. v, c. 22 (1927); see the debates upon this measure, particularly the speech of the Marquess of Reading in Great Britain, Parliament, House of Lords, *Parliamentary Debates*, vol. lxxviii (1927) p. 67-68]. The act of 1927 empowered the attorney general to apply for an injunction against the use of trade union funds for the prosecution of illegal strikes. Ramsay MacDonald's second Labour government in 1931 sponsored a repeal of the act of 1927 and a return to the status created by the law of 1906. The attorney general,

who was in charge of this bill, referred as an example to be avoided to the unique record of American experience with the labor injunction [Great Britain, Parliament, House of Commons, *Parliamentary Debates*, vol. ccxlvii (1931) p. 392-93]. The bill failed, but the act of 1927 has not occasioned a change in English practise.

In the United States appeal to the courts for injunction against strikers was facilitated through the adventitious fact that in the 1870's, following the panic of 1873, great railroad properties were in the hands of receivers and thus, theoretically, administered by courts. Obstructions to the operation of such railroads were treated as obstructions to the courts, and judicial orders against strikers naturally suggested themselves. Disobedience of such orders was followed by summary punishment for contempt of court, which had the advantage of avoiding the cumbersome process of the criminal law. To grant injunctions against strikers in cases other than receiverships was an easy transition for lawyers and judges.

In law as elsewhere imitation is a potent factor. But in the spread of the labor injunction the incisive and quick nature of the remedy was a powerful ally of imitation. An application was made in a labor case for an injunction apart from a receivership in New York in 1880 but seems to have been refused. Such injunctions, however, were granted in Maryland and Ohio in 1883, in Iowa in 1884, in Pennsylvania and Massachusetts in 1888. There were doubtless other instances; legal records in such matters are most inadequate. As a legal institution the labor injunction reached its maturity in 1895, when in the famous Debs case the Supreme Court sanctioned the injunction by which probably the Pullman strike was broken. Thereafter the labor injunction became a customary weapon in the strategy of American industrial conflicts. While no authoritative statistics as to the number of injunctions are available, there are a few straws. For the federal courts from 1901 to 1928 the official reports disclose 118 applications; a congressional investigator in 1914 found 116 unreported injunctions; a private inquiry by Senator Pepper of Pennsylvania disclosed that during the railway shopmen's strike of 1922 nearly 300 injunctions were asked for and granted (see Pepper, G. W., in *American Bar Association, Report*, vol. xlix, 1924, p. 174-80). Of these only 12 seem to have been officially reported. For Massachusetts an official investigator revealed more than 260 cases between 1898 and 1916, and

for New York City there were at least 250 cases between 1894 and 1928.

The grounds avowed by courts for resorting to the injunction in labor cases are the actual or threatened damage to property rights and inadequacy of legal remedies. To resort to the criminal law, it is urged, is to lock the barn after the horse is stolen, and suits for money damage are futile because money cannot compensate; too many suits would have to be brought in view of the continuing nature of the menace, and the strikers are financially irresponsible. Despite the novelty of the remedy and the serious differences between a labor controversy and the situations for which injunctions had been historically employed, the Supreme Court in the Debs case concluded that "the jurisdiction of courts to interfere in such matters by injunction is one recognized from ancient time and by indubitable authority." Contemporary legal scholarship challenges this claim.

The labor injunction derives significance from the mode by which it has operated. What is called procedure determines results. In theory the final injunctive decree alone is an adjudication on the merits; temporary restraining orders and temporary injunctions are nominally provisional. In fact, however, the restraining order and temporary injunction usually register the ultimate disposition of a labor litigation, which seldom persists to a final decree. Lack of resources may frustrate pursuit of the litigation or, as is often the case, the strike has ended before the final stage is reached and ended not infrequently as a result of the injunction. Of the 118 officially reported federal court cases from 1901 to 1928, 70 involved *ex parte* orders and 88 temporary injunctions. Twelve of the *ex parte* orders and 56 of the temporary injunctions were in fact final dispositions. Of 35 temporary injunctions issued by the New York courts from 1923 to 1927 none reached a further stage.

The theoretical safeguards attending the final decree are therefore largely inoperative. Here as elsewhere in law its formal doctrines tell very little of what law does for those who invoke it or against whom it is invoked. Not the so-called principles governing the "rights" and "duties" of the combatants in a strike, but the procedural characteristics of provisional relief furnish the key to an understanding of the labor injunction in action. The truth of the situation is seldom explored through oral testimony, and the proceeding largely resolves itself into a clash of affidavits. These, because they flow from the pas-

sionate partisanship of a labor struggle and are drafted more with an eye to the requisites of legal formula than of truth, are generally contradictory in all important particulars. The judge determines the facts without the aid of a jury, and the usual safeguards for sifting fact from distortions or imaginings—personal appearance of witnesses and cross examination by opposing counsel—are lacking. Finally, the opportunity to correct error by appeal is extremely narrow and seldom exercised.

To be sure, violence is an incident and too often an ingredient of industrial strife in the United States. Latter day labor racketeering is still another story. Whatever the cause for this violence—the ready resort to violence generally, the survival of pioneer traditions, the less rooted habits of the American population, the exacerbation of feeling or the actual incitement to violence by agents provocateurs and proprietary police—the injunction serves theoretically as a swift and effective check. Legal theory therefore justifies it in so far as it explicitly restrains illegal conduct. But departures from this theory are abundant and indeed common. The text of the injunction has grown to be an elaborate and complex document—a fearsome and ambiguous instrument reaching far beyond outlawed excesses and snuffing out trade union activities which as a matter of abstract law are deemed legitimate. Injunctions have restrained innocent conduct through fear of violation of general and all inclusive terms of doubtful meaning. They have restrained conduct that is clearly permissible, like furnishing strike benefits, singing songs, maintaining tent colonies; permissible, that is, on the theory that it is the function of the law merely to keep the peace and maintain the ring between employers and employees according to the prevalent standards of fair economic combat. The dangers of these dragnet decrees have led a few of the more farsighted judges to attempt to define with particularity the line between forbidden and permitted conduct. What can be done by an imaginative and conscientious judge was shown during the railroad strike in 1922 by Judge Charles F. Amidon [Great Northern Ry. Co. v. Brosseau, 286 Fed. 414 (1923)]. While the injunction is the result of a judicial proceeding between two litigants, its obligations frequently, especially in the federal courts, attach to the general public. By the easy device of blanket clauses its prohibitions extend to “all persons whomsoever” or “all persons to whom notice of this order shall come.” All aware of the injunc-

tion must obey it or be punished for contempt.

The practical uses to which the labor injunction has been put have turned it into a persisting political issue. It has maintained itself thus to no small degree because disinterested legal opinion has supported the essential grievances of labor. Some of the most learned scholars of equity procedure have found the labor injunction inconsonant with the traditions and philosophy of the whole equitable process. Ever since the Debs case it has been urged that except under appropriate safeguards and within a defined and restricted area the injunction is not an appropriate intervention in the conflict of forces between employers and employed. The decree places the power of the state upon one side of a complicated social struggle in advance of and frequently altogether without that careful ascertainment of fact which is the traditional protection of the innocent; the injunction invades by indirection constitutional safeguards that speech, press and assembly shall be free from previous restraints; vague and all inclusive terminology customarily employed results in sweeping decrees which subject all activity—legitimate no less than illegitimate—to the peril of prosecution for contempt; and therefore the injunction becomes in effect a penal code enacted, interpreted and enforced by a single judge without the constitutional securities available to persons accused of crime.

The extent to which these consequences of the injunction affect the labor conflict lies almost wholly in the realm of guesswork. There are as yet no dependable data regarding the effect of the injunction upon the progress of unionization in America; and equally meager and inconclusive is the evidence, aside from opinion testimony, of the relation of injunctions to the results of particular strikes. Does interdicted conduct cease or is it intensified? Are injunctions enforced and to what extent and with what consequences? Answers to such questions require an intensive and subtle analysis of the elusive factors of particular controversies in their economic, social and psychological settings. With the exception of some studies in the New York garment industry by Brissenden and Swayzee and a recent inquiry into a few southern strikes by McCracken, social economists have left this field of inquiry unexplored. But considerable evidence has necessarily been gathering upon the effect of the injunction on public opinion, particularly on opinion generated by the feelings of the workers. To the United States Commission on Industrial Relations its director in 1915 reported that

"... there exists among the workers [of whom there were then said to be twenty-five million] an almost universal conviction that they... are denied justice in the enactment, adjudication, and administration of law, that the very instruments of democracy are often used to oppress them and to place obstacles in the way of their movement toward economic, industrial and political freedom and justice."

Labor's feeling against the use of the injunction has certainly not abated since 1915. Nor has its bitterness been appeased by its own occasional resort to the injunction. Labor has employed the injunction as a weapon in internecine conflicts and has invoked it against employers to enforce collective bargaining agreements, to restrain the operation of black lists or to insure some forms of statutory protection. The most significant instance of use of the injunction by labor arose under the Railway Labor Act of 1926 and resulted in a decision by the Supreme Court highly favorable to the workers [*Texas & N. O. R. Co. v. Ry. Clerks*, 281 U. S. 548 (1930)]. On the whole, however, opportunities for such relief have heretofore been comparatively restricted and the gains achieved have not outweighed the detriments. Moreover the circumstances to which the injunction applies when invoked by labor do not lend themselves to the procedural abuses that have developed as the normal concomitants of the injunctive process against labor. It is not surprising therefore that according to the American Federation of Labor the use of the injunction by labor is "a snare and a delusion."

The pressure of labor for its own immediate interests has combined with the desires for reform of those who are concerned over the weakened prestige of the judiciary, particularly of the federal judiciary, and the undermined confidence in even handed administration of the law. From the turn of the century there have been manifold attempts at corrective legislation. In their earlier form they were directed against a modification of the ancient doctrines of conspiracy and restraint of trade as applied to contemporary labor conflicts and later on to the outlawry of agreements by workers not to join or remain members of a union—the so-called yellow dog contracts. Corrective measures did in fact reach the statute books but were in the main nullified by judicial construction. Reform then addressed itself to the procedural aspects of equity jurisdiction in labor cases, ranging from an outright withdrawal of the injunction in labor controversies to the formulation of restricted details in granting such

injunction. Here again the courts largely erased what the legislatures wrote. Thus a California statute of 1903 which specifically forbade the issuance of an injunction was construed by the California state court to have effected no change in the law. A similar statute enacted in Massachusetts in 1914 was found by its Supreme Judicial Court to be a denial of due process of law and of the equal protection of the law and so unconstitutional. On the other hand, Arizona sustained such a statute, although it finally foundered in the United States Supreme Court. Since this decision [*Truax v. Corrigan*, 257 U. S. 312 (1921)] was based on the Fourteenth Amendment it has had far reaching effect upon the movement for dealing with the labor injunction. By the Clayton Act Congress in 1914 seemed to confine the activities of the federal courts in the issuance of labor injunctions to such narrow limits that Samuel Gompers hailed the Clayton Act as labor's magna carta. But the Supreme Court construed the ambiguous language of the Clayton Act to be "merely declaratory of what is the best practice always" [*Amer. Steel Foundries v. Tri-City Council*, 257 U. S. 184, 203 (1921)] and not as remedying drastically the evils which gave rise to the Clayton Act. In effect therefore the decisions of the Supreme Court and the actions of the lower federal courts have so confined the Clayton Act as to leave substantially intact—in some respects even to enlarge—the grievances against the labor injunction which led to the Clayton Act.

The Supreme Court was more hospitable to another important provision of the Clayton Act—that granting right to trial by jury in certain cases of contempt for violation of an injunction—holding it not to be "an invasion of the power of the courts as intended by the Constitution" [*Michelson v. United States*, 266 U. S. 42 (1924)]. This decision was the more significant in that several state courts, interpreting the doctrine of separation of powers as a narrow, mechanical rule of law rather than as a maxim of political wisdom, had invalidated similar state legislation. But in practise this provision of the Clayton Act was narrowly applied.

The labor troubles in the coal, rail and steel industries in the period following the World War, coming at a time of general conservatism and "Red" phobia, led to a series of injunctions, some of which made the Debs decree look mild. These excesses in turn stimulated a new effort for corrective legislation. Some states, like Illinois and New Jersey, enacted analogues of the

Clayton Act, which local courts, following the decision of the Supreme Court upon the Clayton Act, severely limited by construction. A number of states limited—and New York and Wisconsin abolished—the issuance of ex parte orders. In 1928 the Judiciary Committee of the United States Senate proposed a detailed revision of equity practise in labor litigation which sought to withdraw the aid of the federal courts from the enforcement of anti-union agreements, to correct procedural abuses, define and confine discretionary jurisdiction and to extend the right of jury trial for contempt. This proposal became law upon March 23, 1932, when President Hoover signed a bill embodying it (Public no. 65, 72nd Cong., 1st sess., 1932).

In 1931 sixteen state legislatures had before them counterparts of the pending federal measure. One state, Wisconsin, enacted them into law; another state, Pennsylvania, enacted all but the provision invalidating anti-union agreement; and four states, Arizona, Colorado, Ohio and Oregon, followed the earlier lead of Wisconsin in invalidating anti-union agreements.

| <i>Continental</i> | WILLIAM SEAGLE |

LABOR LEGISLATION. No attempt to define the term labor legislation has been made either in the leading work on the subject in the English

language or in the principal collection of American labor laws. Where definitions have been attempted emphasis has generally been placed

upon the protective or regulatory aspects. From the former aspect labor legislation is concerned with "raising the lot of the working classes," from the latter with "exceptions to general rules of freedom of contract." As a statement of the general character and purposes of labor legislation, however, neither concept is wholly adequate, nor are both combined.

Although labor legislation is a form of social legislation and of social and political reform, many important distinctions are involved. Labor legislation considers the worker as such; social legislation and reform treat him primarily as a citizen. Some reforms affect workers directly and some only indirectly, while others may not affect them at all. Labor legislation is moreover not a revolutionary change; it modifies industrial autocracy but affects the capitalist system only in minor respects. It is supplemental to employees' solutions, like trade unionism and collective bargaining, and to employers' solutions, like welfare plans, and is an alternative to such fundamental changes as socialism, communism or Fascism. Social legislation is a narrower concept than social and political reform but broader than labor legislation. Labor legislation whether in the form of statutes, administrative orders or judicial decisions is specifically concerned with regulating conditions of labor and relations between employers and employees. Social legislation includes also such fields as poor relief, public education and housing, only minor features of which can be included within the concept of labor legislation. Social insurance is in general labor legislation, although in some cases it may include non-workers and not regulate industrial relations. Labor legislation originated in humanitarian legislation but has become at once narrower and broader—part of a governmental program for the regulation of industry. Here it merges into social legislation and social and political reform—the general movement to improve and alter social relations; and hence the reciprocal influences are many and important.

Modern labor legislation is generally said to date from the English Health and Morals of Apprentices Act of 1802, but there were many earlier statutes regulating the relations between masters and servants, as in the case of the Statute of Labourers and the many Elizabethan laws concerning working conditions and wages. Contrary to the impression left by some accounts, there was never a sharp break between the old master and servant relation and the modern

employment contract; and many of the early English laws and decisions have exerted a profound influence on the law of employment relations to this day. What really made the act of 1802 notable was not its break with the past but the advent of humanitarian motives in labor legislation; this act, with most of the early labor legislation after the industrial revolution, was inspired by the misery of the working classes, enacted before workmen had the right to vote and trade unions exerted any important influence in the national life, and merely served to protect the weakest workers. Following the pioneer act of 1802, which limited to twelve hours daily the labor of children in cotton mills, England passed a series of factory acts; the first in 1819 further restricted the employment of children. In 1833 special enforcement officers known as factory inspectors were appointed. In the next decade was enacted the first labor law for women, the twelve-hour law of 1844 and in the same year the first law for the safeguarding of machinery, followed a little later by laws regulating dangerous trades and homework. The right to form unions had been legally recognized in 1824–25. Six years later the first Truck Act was passed compelling payment of wages in kind and in full, and in 1862 a preferential wage payments act similar to the American mechanics' lien. The factory acts of 1864 and 1867 broadened the area of factory legislation to include practically all industrial occupations. By this time labor legislation had ceased merely to protect the weakest workers and was coming to cover many of the most important aspects of the relations between employers and employees. This was emphasized by acts passed in 1871, 1876 and 1893, which strengthened the legal status of trade unions; by an act in 1875 to regulate strikes, which provided that a combination to carry on a strike shall not be indictable as a conspiracy unless the acts involved would be criminal if committed by an individual; and by a Conciliation Act in 1896 to settle industrial disputes. The Factory and Workshop Act of 1901 consolidated and improved all the existing factory acts; it strengthened the enforcement machinery and included legislation applying to buildings in construction, laundries and docks. The Trades Disputes Act of 1906 freed trade unions from all liability for torts and swept away the last vestige of the common law doctrine of conspiracy in its application to labor disputes. The advocacy of the trade unions and of the Labour party was a strong factor in

the passage of this act as well as of all subsequent labor legislation. The Coal Mines Regulation Act of 1908, which introduced the eight-hour day, was the first definite regulation by statute of the hours of labor of adult workers. Meanwhile a new development had begun with the Workmen's Compensation Act of 1897, followed in 1909 to 1911 by legislation for employment exchanges, trades boards, minimum wages, health insurance, old age pensions and unemployment insurance. At the same time labor legislation came to assume more and more of a non-parliamentary character because of the enormous increase of administrative enactments regulating industrial relations.

Although it developed much later and on a modified scale labor legislation in continental Europe followed the English pattern. Prussia in 1839 enacted a Children's Protective Act; thirty years later the North German Confederation adopted an industrial code, subsequently incorporated in the legal system of the German Empire, which regulated the labor of women and children. This merely protective legislation affecting the weakest workers was followed in the 1880's by the pioneer introduction of social insurance covering accidents, sickness and old age. At the same time other laws were enacted for the purpose of preventing workers from organizing economically and politically. The scope of more specific labor legislation was extended in 1891 by the Workers' Protection Act, which decreed Sunday rest, safety regulations, a minimum working day and abolition of night work for women and children. Labor legislation now placed increasing emphasis upon adult males; it was moreover supplemented by repeal of the antisocialist laws and by laws legalizing trade unions, regulating collective agreements and strikes and instituting a system of courts for the settlement of industrial disputes. From this time forward the trade unions and the Social Democratic party were important factors in the enactment of labor legislation.

In France the first labor legislation properly so-called was the act of 1841 limiting the working hours of children to eight hours for those eight to twelve years old and to twelve hours for those twelve to sixteen years old; no enforcement machinery was provided, however, and the law was practically a dead letter, as was the general twelve-hour day law enacted in 1848. Until this time such meager labor legislation as had been enacted aimed primarily at suppression of workers' rights; as, for example, the

law of 1791 prohibiting combinations of workers. A factory inspection law was not enacted until 1883. In 1864 the restrictions on the formation of labor organizations were modified; twenty years later trade unions were legalized, and legislation was enacted providing an opportunity for the settlement of industrial disputes without strikes. A workmen's compensation law covering factory workers only was passed in 1898; subsequent legislation awarded compensation to other categories of employees. A substantial legislation gradually developed regulating labor relations in industry but it was mainly concerned with the weakest workers, although public opinion manifested an increasingly strong demand for more comprehensive labor laws and social insurance.

By 1914 the north European countries had labor legislation comparable in scope to the English and the German as well as social insurance systems covering all major industrial hazards except unemployment. Russia and the Balkans lagged considerably behind, with Italy and Spain occupying a middle ground. To a much greater extent than in England and the United States labor legislation in continental Europe was embodied in administrative orders rather than in statutes—perhaps one of the more important reasons why such legislation was considered paternalistic by Americans.

Before the World War labor legislation reached its highest development in Australia and New Zealand, which in the 1890's enacted the first general eight-hour laws, minimum wage laws and compulsory arbitration laws. These Australasian states early abandoned the merely protective principle and promulgated laws covering all groups of workers and all phases of industrial relations. The minimum wage laws set up machinery for fixing minimum wages and indicating the trades in which they were to be fixed and included workers other than women and children. Compulsory arbitration regulates the relations between employers and employees by means of special boards or courts, which in practice, however, have not rendered decisions until all efforts at conciliation have failed. Strikes have decreased but have not altogether disappeared. In 1904 an Australian federal law set up a court for conciliation and arbitration and made strikes or lockouts an offense if the dispute extended beyond the limits of a state. The Canadian Industrial Disputes Act provides a method of dealing with industrial disputes midway between the Australasian system of

compulsory arbitration and the English policy of governmental non-interference except to preserve law and order or to effect a settlement.

In the United States labor legislation developed somewhat later than in England but earlier than in most continental European countries. The earliest American labor laws were the mechanics' lien and wage exemption laws of the 1830's and 1840's. Massachusetts, the most industrialized of the American states, was the pioneer in labor legislation through the nineteenth century and blazed the trail by the enactment in 1836 of a statute providing schooling for employed children; six years later it passed a ten-hour law for children under twelve years of age. By 1853 six other states had similar laws regulating the working time of children. Three states (including highly industrialized Rhode Island) passed laws limiting the working time of women to ten hours, but they were ineffective because of the provision that the laws were operative only in case of the absence of a contract to the contrary. Massachusetts was the first state to enact (1874) an effective ten-hour law for women; and the state was also the first to employ factory inspectors (1867), to establish a state labor department (1869) and to pass an industrial safety law (1877). Other industrial states lagged about ten years behind Massachusetts; many non-industrial states still have few labor laws. Not until the 1880's was there a considerable volume of labor laws in the United States, but ever since it has grown rapidly, with its greatest development in the 1880's and early 1890's and from 1910 to 1915. American labor legislation, however, lagged behind the more progressive European and Australasian countries.

Before the World War labor legislation was still in its initial stage. It was hampered by low minimum requirements in the fields which were covered by legislation and by the absence of legislation in other fields. The administration of labor laws moreover was generally inadequate, although less so in Germany, England and Australasia than in the United States and other countries. The significance of administration is extremely great not only from the standpoint of enforcement but also because so much labor legislation consists of the enactments of administrative bodies. Both the scope and quality of labor legislation and administration were enormously improved in the European, Asiatic and Latin American countries during the war and post-war periods. War requirements

led to legislation on behalf of the workers in all the belligerent countries, such as the eight-hour railroad labor law enacted by the American Congress, while in the post-war period labor legislation was stimulated by the radical mood and increasing strength of labor in Europe and by the acceleration of industrialization in Latin America and Asia; a contributing factor was the inclusion for the first time in history of labor clauses in the peace treaty, which provided for an International Labor Office and international labor conferences to consist of the representatives of governments, employers and workers.

England during the war promulgated considerable labor legislation in the form of a series of munitions acts under which minimum wage rates were established and for the time something akin to compulsory arbitration was instituted for a large part of British industry; workmen's compensation acts which increased benefits in an attempt to offset depreciation of the currency; and an act to strengthen the powers of the trade boards set up in 1909 to regulate wages. After the war labor legislation increased greatly. Minimum wage legislation was again broadened and in 1924 agricultural wages boards and agricultural wages committees were provided to fix minimum wages for agricultural workers. A series of acts further regulated labor conditions in mining; one act provided a fund for "social improvement." Another series of acts made minor changes in the workmen's compensation laws by strengthening the administrative machinery and extending the compensation to include salaried employees; but the labor group is very much dissatisfied with the law and has urged extensive changes. The scope of social insurance was made more inclusive. Unemployment insurance was extended to practically all industries in 1920 and in 1929 the Industrial Diseases Compensation Act consolidated the existing laws and listed twenty-eight compensable diseases. In 1921 the British Railways Act set up a Railway Wages Board, but its decisions were not mandatory. This non-compulsory feature also characterized the permanent machinery for arbitration of industrial disputes set up by the Industrial Courts Act of 1919 and the "parliamentary self-government" of the Whitley industrial councils for cooperation between employers and employees. The development of labor legislation parallels increasing state intervention in industry as a whole; as, for example, the government machinery for the unification and development of the electric power industry.

French labor legislation is mainly a product of the post-war period. The war legislation, including minimum wage laws, was merely a prelude to larger developments. In 1919 under pressure of popular demand and despite the opposition of employers the government adopted the principle of the eight-hour working day without reduction of wages. In the same year a law was enacted providing compensation for certain industrial diseases. During the succeeding years the eight-hour law was introduced by administrative decrees to cover nearly all employees, who were given joint representation with the employers in the administrative machinery to enforce the law as well as in that to fix minimum wages. In addition to enactments extending the scope of legislation on industrial diseases an improved workmen's compensation law was enacted in 1925, in the passage of which trade union agitation was an important factor. In general the most significant factor in the development of labor legislation in post-war France was the real activity of the reformist *Confédération Générale du Travail*, which separated itself from the communist unions, abandoned the pre-war syndicalist distrust of the state and legislation and developed a program for the enactment of comprehensive labor laws. The reformist unions moreover are represented on many consultative organs set up by the state to advise on problems of labor and social legislation. The culmination of these developments was the Social Insurance Law of 1928, subsequently modified because of violent opposition by the employers. At the same time machinery has been set up by law in many industries regulating collective bargaining. Simultaneously state intervention in industry has grown greatly, as evidenced in the attempts at national economic planning.

The greatest development of labor legislation in the post-war period took place in Germany. The revolution in 1918 brought an eight-hour law. In the following year the Weimar constitution laid the basis for a comprehensive unified development of labor legislation in the following constitutional provisions: "The organization of economic life shall be based on principles of justice, with the aim of assuring to all the conditions worthy of a human being. . . . Labor is under the special protection of the federal authorities. . . . Manual and non-manual workers shall be called upon to cooperate with employers on an equal footing in the regulation of wages and labor conditions." Out of the

latter provisions grew the Works Councils as the basis of labor-capital cooperation, but which were gradually reduced to practical insignificance by the action of employers. A series of new labor laws was enacted to meet new conditions and the growing strength and demands of the workers. They regulated industrial safety, giving the Ministry of Labor extensive powers to define requirements for specified undertakings; hours of labor, based on acceptance of the eight-hour day, including regulation of overtime and increased protection for women and children; and introduced more effective labor inspection and enforcement machinery, with broader powers delegated to the federal government. There are also provisions institutionalizing collective bargaining, courts for the compulsory settlement of industrial disputes, legal recognition and regulation of collective agreements and the regulation of wages. Social insurance covers all hazards that affect the workers. German labor legislation is now probably the most highly developed in the world; it best represents, moreover, the tendency of such legislation to become part of a coordinated program of government regulation of industry.

In most of the other European countries also the post-war period witnessed a great development of labor legislation. Austria followed the German pattern, including the eight-hour day and works councils. Czechoslovakia has a series of labor laws, including social insurance, of the most progressive character, although they are scattered and not yet unified in a comprehensive labor code. Since the establishment of the republic Spain has enacted a series of labor laws modeled on the legislation of the most advanced countries. Hungary is still extremely backward in its labor legislation, which is mainly of an elementary protective character; scarcely any new labor laws have been enacted in recent years. Poland is also backward, although it has an eight-hour law, limited unemployment insurance and a measure of regulation of collective bargaining. In Italy the Fascist regime has introduced some additions to labor legislation; its main contribution has been a new system of administration, the prohibition of strikes and strict governmental supervision of the trade unions. Great progress in labor legislation has been made in Soviet Russia, where the trade unions participate directly and actively in the enactment and administration of labor laws.

Of the non-European countries other than

the United States the most important development of labor legislation has taken place in Japan, China and Latin America. Japan's pre-war labor laws were wholly inadequate, consisting of a factory law and a mining law which served to protect only the weakest workers, and which were poorly enforced. Since 1919, however, legislation has been enacted with regard to employment exchanges, health insurance (accidents and diseases) and conditions of labor in factories, including a minimum working age of fourteen, and maternity protection. In 1924 legislation was enacted providing for arbitration of industrial disputes, compulsory or optional according to circumstance. China in recent years has adopted labor laws of the most progressive character, but they are not enforced. The standard of labor laws in other Asiatic countries is low. Canada's legislation, which developed almost wholly after 1900 and has been improved since the World War, includes safety regulations, unemployment exchanges, workmen's compensation, minimum wages for women and conciliation of industrial disputes, national and provincial. Canadian labor legislation has been influenced strongly by that of the United States and compares favorably with that of the advanced American states. In Latin America labor legislation is mainly the product of the past twenty years. It is based on the European model and includes all phases of labor legislation, although not all in the same countries. Mexico has a series of comprehensive labor laws, which are, however, inadequately enforced. Some of the Latin American countries, such as Argentina, Chile and Uruguay, have labor laws which compare favorably with those of European countries. Most of them have ratified the conventions adopted at the international conferences of the International Labor Office, including the eight-hour day. There is considerable protective wage legislation (including the dismissal wage) and protection of women and children. Unions are generally recognized as legal, but little legislation on collective bargaining has been enacted.

In the United States there was little development of new types of labor legislation in the post-war period, although existing labor laws were strengthened and their administration materially improved. In this period labor legislation was retarded by unusual prosperity, increased opposition on the part of employers, the suspicions of a large element in the trade unions and the critical attitude of a majority of the United States

Supreme Court toward all extension of governmental control over industry. Since 1929 depression has made the American public much more sympathetic with labor legislation and the attitude of the Supreme Court has been more liberal. The volume of labor laws enacted in 1931 was probably greater than in any other year of American history.

After the mechanics' lien and wage exemption laws the first important labor laws in most of the American states were those restricting child labor. These at first set very low standards: ten-year age limits and maximum eleven or twelve-hour workdays in factories with no restrictions on the employment of children in other industries. More adequate child labor laws date from the 1880's. By 1900 practically every state had some legislation on the subject. A strong impetus to higher standards was given by the passage of the two federal child labor laws of 1916 and 1919, both of which were held unconstitutional, and the submission of a proposed child labor amendment to the Constitution of the United States in 1924, which failed of adoption. Coordination of child labor with compulsory school attendance laws began quite early and part time education for employed children was introduced by the Wisconsin pioneer law of 1911 and the passage of the Smith-Lever Act by Congress in 1916. Today child labor legislation in the United States is still spotty but distinctly in advance of that of any other country.

Legislation regulating hours was first enacted after the Civil War, although there was agitation much earlier. The first laws were applicable to all employees, but they applied only when there were no provisions to the contrary in existing employment contracts. Compulsory laws have been confined to women and to public and quasi-public employees and to industries presenting peculiar health or public safety hazards. This development has been due largely to decisions holding restrictions on the hours of labor of adult male employees to be unconstitutional in the absence of peculiar hazards. In this respect legislation in the United States is far less advanced or extensive than in Europe and differs further from European laws in that it generally prescribes absolute limitations, while the continental (but not the English) laws establish only a standard of hours which may be set aside in emergencies upon payment of an increased wage for overtime.

American wage legislation is still more limited, although some types were among the

earliest of labor laws, and has been regarded askance by the courts even more than legislation of hours. Laws dealing with incidental features of the wage contract, such as time and manner of payment; laws giving preference and special protection to wages due workmen, whether they appear as creditors or as debtors; laws extending governmental assistance in the collection of wage claims; and laws prescribing the wages to be paid by contractors engaged in public works are generally regarded as unconstitutional. Attempts to regulate wage rates paid adult employees in private employments have, however, been discouraged by the courts. In the second decade of the present century more than a dozen states and also the national Congress for the District of Columbia enacted minimum wage laws applicable to women and minor employees, but the District of Columbia act was held unconstitutional in 1923 by the United States Supreme Court. While some of these laws are still being enforced they have only precarious authority except as to minor employees and all further development of minimum wage legislation has been checked, although there is still some hope that a constitutional basis may be found for laws establishing minimum rates to be paid adult employees.

Safety legislation did not appear except in Massachusetts until the 1880's, but in a very short time it exceeded in volume every other type of labor legislation. Until 1911 all safety legislation was embodied in statutes describing in detail what machinery was to be guarded and sometimes how this was to be done; but since that year statutes have laid down the general standard that employers must provide safe employment, while the labor department is delegated to make detailed administrative regulations as to what guards and other protective methods are deemed safe. The bulk of industrial safety laws in the United States is now to be found in administrative orders; safety legislation is much more extensive than in European countries but not nearly so thoroughly enforced. Legislation relating to sanitation and health hazards in industry is, however, far less extensive in this country than in Europe. Very few processes and substances are subject to special regulation, while in Europe there are numerous prohibitions.

The United States is also far behind Europe in public employment exchanges. Despite the fact that the first public employment office was established as long ago as 1890 (in Ohio) and

notwithstanding the great interest during each depression period in a more efficient employment service there were in 1932 fewer than 250 free public employment offices, while there were at least 3000 fee charging private employment agencies. Some of the existing public offices are conducted by the federal government, but the majority are under state or city control and only loosely federated with the United States Employment Service. During the depression following 1929 larger federal appropriations have once more made expansion possible, but this has apparently been more competitive than cooperative with the states. Private employment agencies are subject to regulation in most states, but the United States Supreme Court has held that they cannot be prohibited and that the states cannot prescribe the maximum fees they may charge. Judging by the large number of complaints, regulation in most states is far from effective but is gradually becoming more strict.

The United States is deficient also in social insurance legislation, although more attention is now given to workmen's compensation than to any other type of labor legislation. The first workmen's compensation laws held constitutional were enacted in 1911, and within the next four years the great majority of the states passed such acts. Today all but four states have compensation laws, and no other type of labor legislation has so generally met the approval of American public opinion. These compensation laws resemble much more closely the English workmen's compensation acts than the continental European accident insurance laws. With one exception they require no contributions from employees and the liability is imposed on the individual employer rather than on social insurance funds. Unlike the English acts most of the American laws require employers to insure their liabilities and to set up special tribunals for their administration. The American compensation laws do not cover all employees. The entire group of railroad employees concerned with the actual movement of trains, practically all agricultural and domestic employees, all employees in small establishments and varying groups of other employees must still in cases of accident look for recovery to the common law as modified by employers' liability laws. These laws, many of which antedated workmen's compensation, are distinctly favorable to recovery but do not escape the necessity of establishing negligence on the part of the employer before the injured employee has any claim.

After workmen's compensation had spread through the United States it was expected for a time that health, old age and invalidity insurance would follow, as in the case of accident insurance in Europe. No state, however, has ever enacted a health insurance law and the question has received little attention since the World War. Fourteen of the workmen's compensation laws have been amended to include at least some occupational diseases, but this is by no means a substitute for health insurance. Since 1923 old age pension laws have been enacted in fifteen states, but unlike the European laws they are non-contributory and are not limited to workers in industry. No state adopted any unemployment legislation until 1932 and the Wisconsin unemployment reserves act (effective July 1, 1933) contemplates individual plant reserves rather than a central insurance fund as in the English and European systems.

The law governing collective bargaining, labor organizations and labor disputes is in the United States almost entirely a matter of judicial decisions rather than of statutes. The majority of the statutes in this field have had for their object relieving labor from restraints imposed through court decisions but have been so construed that they have had little practical significance. Statutes extending favors or protection to labor organizations, except laws to prevent infringement of union labels, have been held unconstitutional, and some general laws not originally considered to have had any application to labor disputes, such as the federal antitrust acts, have been interpreted to impose additional restrictions. This by no means exhausts all of the American labor legislation. There is a considerable volume of special legislation for public employees and the employees of public service companies, particularly the railroad workers. Very important to the trade unions are the immigration and convict labor laws. Similarly, licensing laws for trades, apprenticeship laws, building and fire prevention codes, adult and vocational education and vocational rehabilitation all have important labor aspects.

Labor legislation in the United States has developed piecemeal and as a remedy for specific evils. Each proposal has had a somewhat different group of proponents and opponents. The strongest support for labor legislation has come from the trade unions; liberal political, civic and church groups; progressive, pioneering employers; social workers; labor departments; and stu-

dents of labor problems. It has been opposed most commonly by employers' associations and on social insurance measures by the casualty insurance companies and the medical associations. In recent years the feminist group known as the Woman's party has fought against all special labor legislation for women. Every type of labor legislation before its enactment has had the support of some progressive employers, and nearly all labor laws have after enactment been accepted by the great body of employers. Neutral groups not directly identified with industry have often been the arbiters between the trade unions and the employers' associations in contests over labor legislation. Jealousy of the farmers and distrust of the trade unions by the middle class have retarded progress, but the organized farmers have generally supported labor legislation favored by the unions.

After enactment nearly all American labor legislation has been challenged in the courts. Most labor legislation restricts the right of contract and consequently is attacked as a denial of liberty and a seizure of property without due process of law. In defense the police power of the state is invoked—the right to restrict freedom of contract in the interests of the general welfare. The question of constitutionality in the final analysis depends upon whether the courts see a relationship between the challenged law and the general welfare. Great weight attaches to precedents, but really decisive is the view of the state and federal supreme courts of the reasonableness of the legislation.

A further ground for attack on some labor laws arises out of our federal system of government. Attempts of the national government to regulate labor conditions, particularly child labor and workmen's compensation, are challenged as an invasion of the rights of the states; and some state legislation has been held to amount to an interference with interstate commerce. The regulation of labor conditions is mainly within control of the states; but railroad and maritime employments present many problems in which the dividing line between the state and federal jurisdictions is shadowy, and many a labor law has been annulled because it overstepped this indistinct line. For this reason and because of the further consideration that labor regulations should be uniform throughout the country in order not to handicap some employers many advocates of labor legislation have favored extension of federal jurisdiction. The great outcry over states' rights which followed the submis-

sion of the federal child labor amendment, however, showed that such extension is not yet within the range of practical politics.

The list of labor laws which for one reason or another have been held unconstitutional is a long one, but the list of those which have been sustained is much longer. The courts have been inhospitable to laws favoring organized labor and to minimum wage laws for adult women employees, have viewed with suspicion other attempts at wage regulation and all legislation of hours for men and have greatly weakened the regulation of private employment agencies. They have, however, sustained the great mass of labor legislation and in a number of fields have reversed earlier adverse decisions. No important labor law once enacted and sustained by the courts has ever been repealed.

Despite its piecemeal character and uneven development in different countries labor legislation tends to follow a definite pattern. The fundamental influence involved is the change in the relations between employers and employees produced by the development of industrialism. This new order in its struggle against feudal restrictions emphasized the economic individualism of *laissez faire* and limited the state's intervention in industry. But economic individualism itself forced such state intervention. The state was early compelled to enact laws regulating competition, commerce, transportation, banking and corporations. Where state aid might facilitate any particular economic development, as in the building of railroads in the United States, it was secured regardless of the theoretical assumptions of *laissez faire*. Simultaneously economic competition and the increasing use of machinery led to the growth of large scale industry and eventually of monopolistic combinations severely limiting economic individualism and forcing legislative regulation. Employers moreover organized into associations to further their mutual interests. Similarly workers organized into their own associations, the trade unions. The pressure of these developments obliterated the pattern of individual liberty, economic individualism and freedom of contract. The state was forced to intervene to develop a program for the regulation of an increasingly collectivist industry, and labor legislation was an integral part of that program.

But while the theoretical assumptions of *laissez faire* were profoundly modified in practice by the growing integration and complexity of industry and by state intervention, the prin-

ciples and ideology of individualism persisted beyond their historical necessity. Thus the development of labor legislation assumed the form of a conflict between the claims of individualism—"individual liberty" and "freedom of contract"—and the needs of the workers in an increasingly collectivist economic order. The abandonment of "personal liberty" which was involved in legislation regulating the employment of child labor was accepted on the theory that children were not free agents; but similar legislation for adult female workers was opposed on the ground that the state should not interfere with the "rights" of free women. At every stage opposition to new legislation was particularly strong in the United States, where the principles of individualism had been incorporated into constitutions which were later invoked to declare labor laws unconstitutional.

Behind the struggle of "principles," however, was the clash of antagonistic class interests. The employers accepted state intervention where it aided the growth of industry or assumed the form of labor legislation directed against the workers, such as the English legislation of 1800 which made it a criminal offense for workers to combine and strike and the American judicial decisions on "criminal conspiracy"; but they usually opposed vigorously the enactment of legislation in behalf of the workers. The workers, on the contrary, pressed for labor legislation—for protective laws and for laws granting the right to organize, to bargain collectively and to strike. Labor legislation emerged out of the struggle between labor and capital and bore the scars of that struggle; throughout the state acted mainly but not entirely as holder of the balance of power. On the whole, labor legislation developed most fully where the economic and political organizations of labor were strongest, as in England and Germany, although humanitarianism in the one country and state paternalism in the other were originally important factors. In France before the World War the labor movement under syndicalist influence was antagonistic to labor legislation and hampered its development. In the United States, while trade unions have been the most important factor in the passage of labor laws, American unions have characteristically stressed direct control of working conditions, while the European unions have generally stressed legislation. In general the minimum conditions provided by labor legislation in the United States seldom went beyond the gains already

secured by trade union action, but legislation spread the gains among unorganized workers.

The growth of trade unionism influenced labor legislation in two ways: by the enactment of protective laws and by the enactment of laws regulating bargaining between employers and employees. No such regulation was necessary (except negatively in the form of repressive measures) where the assumption prevailed of an equality of right between the employer and the employee, since this made bargaining a personal relation in which the power of the employer arbitrarily decided the issue. But where the workers organized and insisted on collective action and strikes, the state was forced to intervene and define the "rights" involved. This intervention resulted eventually in legislation making unions and strikes lawful, although the state may still impose various forms of limitations upon both, ranging from the invocation of "law and order" to the institution of compulsory arbitration. Collective agreements moreover led to legislation defining the status of these agreements; in Germany and elsewhere in Europe, for example, employers and employees are prohibited from making individual contracts in violation of the minimum conditions specified in the collective agreements.

Although labor legislation in its later and larger aspects was mainly the result of increasing labor strength, organization and action, there were many significant contributing factors. The original humanitarian motive merged with the general reform movement and with the belief that the evils of unrestrained industrialism were too great for charity, that the public was seriously affected by strikes and that employers should not be permitted to burden the community with the costs of both. Out of this emerged the concept of community welfare and standards, and arguments were advanced that labor legislation raised the level of social life by improving modes of living, education and culture. The ideology of social reform through labor legislation acquired considerable independent influence, operating mainly through democratic and pressure politics and professional reform groups advocating labor legislation. Certain employers moreover came to support specific labor legislation to compel uniform standards and to equalize competitive conditions, strengthened by the conviction that better working conditions whether granted voluntarily or imposed by legislation tended to increase efficiency and productivity. Much labor legis-

lation represents merely the compulsion of certain employers to adopt standards which a large part of the industry has already adopted; progressive employers are always ahead of legal requirements, and although they may favor self-government in industry they deem legislation to be necessary to bring laggards into line and deprive them of competitive advantages. Such motives were supplemented by the desire to assure peaceful relations between labor and capital. Finally, both labor and capital in newly industrialized countries were influenced in their attitude toward labor legislation by the experience of older countries.

The results of labor legislation have often disappointed the high hopes of its proponents yet have by no means been a negligible factor in labor's advancement. Labor legislation sets only minimum standards, which are generally far below those for which organized labor is contending. To organized workmen labor legislation has meant a slight raising of the level of the competition which they have to face from the unorganized and the improvement of incidental (although not unimportant) conditions of employment for which it is not practical to go on strike. To the unorganized workmen it has meant much more—securing a part of the advantages which the organized workmen win through their own efforts. To employers labor legislation has operated as a slight restriction upon their freedom to handle their labor problems as they see fit and as a small increase in costs to the advantage of competitors not similarly restricted, but it has not been without offsetting benefits. It has been an important factor in directing attention to personnel problems and has operated as a strong stimulus to the improved methods for dealing with these problems which were adopted so widely in the United States during the prosperity period of 1923-29. Moreover by removing entire issues from all controversy between employers and employees it has narrowed the field of conflict and promoted better relations.

One of the most important recent developments is the growth of international labor legislation, which the Labor Office of the League of Nations is actively promoting. The greatest obstacle encountered is the varying character of labor legislation in different countries; even when there are identical laws the provisions and benefits may vary to such an extent as to render them totally dissimilar on a comparative basis. In addition to the progressive and ideological

factors involved international labor legislation is most important economically from the standpoint of countries actively competing for foreign trade. The export industries are usually large scale with heavy fixed capital, and competitive changes in the export market tend to depress wages and labor conditions in the industries affected, a situation which might be prevented or modified by international labor legislation or agreements. The competitive drive itself, however, tends to prevent the adoption of the proposed measures of regulation and the higher labor standards involved.

The basis, scope and probable future development of labor legislation must depend upon a complex of economic and social factors. There are economic limits to labor legislation, determined by the efficiency of industry and the productivity of labor. But while labor legislation may not exceed these limits it usually falls short of them. Another factor is the power of the various social classes: while efficiency and output of industry are lower in Germany than in the United States, labor legislation is more highly developed in Germany because of the greater strength of organized labor. Both the economic and the class factor will determine the future of labor legislation; that future, despite forces to the contrary, will probably witness a further extension of labor legislation.

EDWIN E. WITTE

LABOR LAW. *Anglo-American.* About the beginning of the nineteenth century English and American judges began to work out a body of legal doctrines for dealing with employment relations. The process was the familiar one of the common law, the rule enunciated in the decision of each case serving as a landmark for guidance in subsequent cases. In the course of the evolution of this body of labor law the judges in the several states of the United States have borrowed their precedents freely from other states and from England and the English judges have occasionally resorted to American precedents, although the doctrines are by no means uniform in all jurisdictions and the differences have been accentuated by legislation.

The employment situation after the coming in of the factories was radically different from what it had been before, and the common law and equity courts had not concerned themselves much with the older situation. The judges did not at first attempt to work out a body of law peculiar to employment but, so far as they were

not controlled by statutes, derived their precedents from general principles of English law supposed to be of universal applicability. The fundamental assumption was that employer and employee were free parties owing each other no legal duties except those which every person owes to every other or which each has voluntarily incurred by entering into a contract. In practice of course employees may be compelled to obey many requirements imposed by employers and employers may be constrained to observe restrictions imposed by labor unions; but such obedience on each side is not a matter of legal duty, unless it has been embodied in a contract, and the utilization of economic compulsion will not necessarily be regarded as a violation of the "equal freedom" of either party. Even when embodied in a contract enforcement may frequently be impracticable—too expensive for the employee, of no avail to the employer if the employee is incapable of paying a judgment for damages. The law cannot be regarded as settled as to whether collective agreements negotiated between a union and an association of employers are binding contracts at all or if so whether they confer rights and impose duties on the organizations as such or on the individual members of the two organizations.

In addition to contractual obligations incurred by the employer statutory duties have been imposed on him in regard to safe and sanitary factory conditions, workmen's compensation, methods of wage payment and in some cases hours of employment. To the extent that such matters are controlled by statutes they are removed from the province of free bargaining.

The bargaining process, at least before the growth of strong unions, as a rule gave the employer the upper hand. The theory was that each party had equal rights and duties and that superior economic position was due to superior service rendered to the community; the results were thought to conform to natural economic laws. The removal of many of the specific mercantilist restrictions on economic activity and of the feudal privileges of the aristocracy gave strength to this notion, flattering to the employing class and serviceable to them as an argument against labor legislation, which by improving the relative position of the workers seemed to disturb that equality before the law on which the economic inequalities were supposed to rest.

The premise of legal equality was in fact fallacious, for legal rights, privileges and duties

depend on property rights and these depend on the law. Each person has a legal duty not to infringe any other person's property rights, a privilege to use what he himself owns and a right to exclude everyone else therefrom except on his own terms. These statements, however, are empty abstractions until it is specified to what particular objects the property rights of each attach; when it is so specified, the specious equality disappears. A's duty not to infringe the property rights of others may circumscribe his legally permissible activity within very narrow bounds; his privilege to use his own property, if he owns practically nothing, may not suffice to permit him to eat or to produce food without obtaining another's consent; and his right to exclude others may serve no more than to protect the clothes on his back. B, on the other hand, despite his duty not to infringe the property rights of others may by virtue of his right (or that of the corporation in which he owns stock) to exclude others from very important property be able without effort to induce many others to pay him a generous income. The respective legal rights of A and B are equal only in the most formal and empty sense. Nor are they merely the reflection of inequalities in services rendered in the past on the basis of preexisting equal rights. Many of the inequalities are the outcome of the purely legal factor of inheritance of large estates on the one hand and on the other of legal exclusion from opportunity during childhood to acquire health and training in economic usefulness. The ultimate economic position of each person is not so rigidly predetermined at birth as in the feudal system, but the law still imposes vastly unequal handicaps.

As applied to the employment relation the dogma of equal freedom has taken the form of the assertion that "the right of the employee to quit the service of the employer, for whatever reason, is the same as the right of the employer, for whatever reason, to dispense with the services of such employee" [*Adair v. U. S.*, 208 U. S. 161 (1908)]. As a corollary each may prescribe the conditions upon which he will employ or accept employment. On this theory whatever compulsion is involved in the threat of withholding the job or withholding the services is legal and even if sufficient to bring the other party to terms the law will interpose no objection. Some limits, however, have been placed on this theory.

In the early nineteenth century, before the

doctrine of equal freedom had been firmly established, a combined threat to withdraw labor was looked upon askance. Such a combination might disturb the actual power of the employer to dictate the conditions of his plant. A combination of workers to refuse to work was made criminal in England by statute in 1800; in the United States a combination of workmen was held without the aid of legislation to be a criminal conspiracy in the case of the Philadelphia cordwainers, decided in the Mayor's Court in Philadelphia in 1806.

The doctrine of criminal conspiracy is now obsolete as applied to labor disputes. In England it was abolished piece by piece by statutes passed in 1824, 1825, 1871 and 1875. In the United States it received what was perhaps its death blow in the opinion rendered by Chief Justice Shaw of Massachusetts in 1842 in the celebrated case of *Commonwealth v. Hunt* (45 Mass. 111). In neither country today is a combined withdrawal of labor criminal; nor is it necessarily even actionable in a civil suit, although it may be.

But there are limits to the legally permissible use of economic pressure. To cut off the employer's "free flow" of labor or of customers by means of violence is an illegal method of inflicting economic loss upon him. Nor is actual violence essential to render the means illegal. Threats of violence would clearly suffice; and some courts have enjoined threats of social ostracism. In a few states picketing is prohibited altogether on the ground that it necessarily involves threatened violence. The restrictions on picketing differ from state to state, but a state statute denying the remedy of an injunction against abusive and noisy but non-violent picketing was held unconstitutional in *Truax v. Corrigan* [257 U. S. 312 (1921)]. In England peaceful picketing was legalized by the Trade Disputes Act of 1906, but the act of 1927 imposes criminal penalties for some forms of it at least. In the United States the supposed legalization of peaceful picketing (as far as federal law was concerned) in section 20 of the Clayton Act of 1914 has been given a very restricted interpretation, which the Norris-La Guardia Act of 1932 attempts to enlarge.

Even when there is nothing illegal in the means, a strike is not necessarily lawful. Like most bargaining pressure it is aimed to compel a reluctant employer to forego the exercise of what may loosely be termed a "right." When so viewed, it is easy to jump to the conclusion that

the strike violates his right and is therefore unlawful. Much confusion results from a vague use of the term right, which the adoption of Hohfeld's careful terminology would avoid. Under this terminology it cannot be premised that the employer has a legal right to pay low wages or operate long hours or on a non-union basis; it can be said at the outset only that he has a "privilege" to do these things—meaning merely that in so doing he is not violating a duty. Whether in addition he has a right not to have the privilege interfered with by a strike (implying a correlative duty on the part of the strikers not to interfere with it) is the very question at issue; the right does not necessarily follow from the privilege.

The courts which have been clearest on the question have developed what has been called the *prima facie* tort theory, according to which there is a *prima facie* presumption that the intentional infliction of damage or economic loss on the employer is illegal; but the presumption can be rebutted by showing a justification. This usually takes the form of proving that the defendants were attempting to promote some reasonable and not too remote interest of their own: in deciding what sort of interest is reasonable and not too remote the courts must face an issue of policy. When justification is not proved it is sometimes stated that the motive of the defendants was one of "disinterested malice." According to some statements malice in the sense of ill will is essential to make the conduct illegal; according to others it is immaterial. Still other judges use the word malice as indicating merely the legal conclusion that the infliction of damage is unjustified. The word is so slippery that it seems better to follow those judges who drop it altogether. However, some judges of the English House of Lords, as the discussion in *Sorrell v. Smith* [(1925) A. C. 700] indicates, still inquire into the state of mind of the defendants and indulge in speculation as to whether their real motive was to harm the plaintiff or to benefit themselves, forgetting that the real motive was probably to harm the plaintiff in order to induce him to act in a way which would benefit the defendants.

The *prima facie* tort doctrine apparently does not enable an employee to make his employer show a justification for discharging him, although it might avail him against one who without justification induces his employer to do so. In *Coppage v. Kansas*, 236 U. S. 1 (1915) it was held that the legislature might not constitution-

ally make it a crime for an employer to discharge an employee for refusing to sign a yellow dog contract—an agreement not to be a member of a union while holding the job. The court did not find any need for justifying the employer's conduct. It may possibly have assumed that the employer's interest in the union affiliations of his own employees would be a sufficient justification. More probably its attitude is to be accounted for by the notion that the *prima facie* tort doctrine applies only to affirmative acts and that mere non-feasance is never a tort. Refusal to continue to employ is regarded as non-feasance, as is also refusal to continue to be employed; but a strike involves the affirmative act of combining. The distinction is made more readily acceptable to the courts by the bad odor which still clings to the concept of a conspiracy and by the modern rationalization to the effect that acts harmless enough when performed by persons acting singly may become intolerable when performed by many acting in concert. The rationalization ignores the fact that discharge by a single employer may frequently be far from harmless to the discharged employee if he can find no other job in his chosen occupation. There is no real reason why conspiracy should be essential for the application of the *prima facie* tort doctrine nor would its application to the discharge of an employee for failure to comply with "unjustified" conditions of employment involve imposing upon the employer an affirmative duty to employ; it would involve only the negative duty to refrain from the act of imposing those conditions.

Courts which apply the *prima facie* tort doctrine differ as to what constitutes a justification for the intentional infliction of damage by means of a strike. Higher wages, shorter hours and improved working conditions are quite generally regarded as justifiable ends. Strikes for a closed shop are apparently regarded as unjustified in Massachusetts but justified in New York. When a union attempted to instigate non-union workers in another shop to compel the latter's employer to unionize, the attempt was said to be illegal by Justice Pitney in *Hitchman Coal & Coke Co. v. Mitchell* [245 U. S. 229 (1917)]. Here, however, he did not apply the *prima facie* tort doctrine and bring into the open his grounds of policy for condemning the union's campaign; he asserted merely that the union was interfering with the employer's "undoubted right" to operate on a non-union basis. Chief Justice Taft, however, in 1921 suggested that unions

had a legitimate interest in making "their combination extend beyond one shop" (*American Steel Foundries v. Tri-City Central Trades Council*, 257 U. S. 184), and the New York Court of Appeals in 1927 made an even more definite pronouncement to that effect in *Exchange Bakery & Restaurant, Inc., v. Rifkin* (245 N. Y. 260). In the latter case an injunction was denied despite the fact that the union was inducing the plaintiff's waitresses to break their promises to remain out of the union. These promises, said the court, when attached to employment contracts terminable at will, were lacking in consideration and did not constitute valid contracts. This view of the law of contracts is at variance with that of the federal courts, as evidenced in the *Hitchman* case, which in addition to the grounds which have been stated held that inducing the breach of a yellow dog contract was an illegal means of conducting the campaign. The *Norris-La Guardia* Act of 1932 provides that such contracts are against public policy and shall not afford any basis for the granting of legal or equitable relief in the federal courts. It has been suggested that this provision violates the constitution in the same manner as did the legislation in the *Coppage* case. The latter, however, made it a crime to insist on such contracts, while the federal law merely makes the contracts unenforceable. The language in the *Coppage* case was broad enough to indicate that any legislative interference with the bargaining power of the employer would be held to be an unconstitutional interference with liberty of contract, unless it had direct reference to health, safety or morals. But this inference is shaken by the opinion rendered in 1930 by Chief Justice Hughes, who had dissented in the *Coppage* case, affirming an injunction under the *Railway Labor Act* which restrained the company from interfering by threats of discharge and the like with its employees' free choice of representatives to negotiate for them (*Texas & New Orleans Railway Co. v. Brotherhood of Ry. & S. S. Clerks*, 281 U. S. 548).

A boycott seems to require greater justification than a strike, although courts have not agreed on the legality of the various types of boycott. Boycotts against employees have at times been pronounced illegal, as in *Carlson v. Carpenter Contractors' Ass'n* [305 Ill. 331 (1922)] and in *Cornellier v. Haverhill Shoe Mfrs.' Ass'n* [221 Mass. 554 (1915)]; in the latter case, however, equitable relief was denied on other grounds. A refusal of a union

to work on partly finished non-union materials in order to favor those manufacturers who employ other members of the union, while held lawful in New York [*Bossert v. Dhuy*, 221 N. Y. 342 (1917)], has been held by the Supreme Court to violate the Sherman Anti-trust Act when aimed against a producer in another state [*Bedford Cut Stone Co. v. Journeymen Stone Cutters' Assn.* 274 U. S. 37 (1927)]. The exemption in section 20 of the Clayton Act had been previously held inapplicable to a controversy between an employer and the employees of other employers [*Duplex Printing Press Co. v. Deering*, 254 U. S. 443 (1921)]. The exemption would probably apply, however, to a controversy between the strikers and their own employer, except where violence or other specifically illegal means is used, even if the employees were directly engaged in interstate commerce. But when there is violence, even if the strikers are not so engaged, their illegal stoppage of production intended for such commerce may be construed to be a violation of the Sherman Act, thus giving the federal courts jurisdiction. The test seems to be whether the motive is to prevent the employer from competing with unionized plants in other states and whether the effect of the stoppage might reasonably be supposed to affect prices in other states. Where this is the case the restraint of interstate trade is called direct; otherwise it is called incidental and is said not to violate the federal law, however flagrantly it may violate state laws against violence. In cases of perfectly peaceable boycotts the federal courts have jurisdiction under the Sherman Act if the boycotts involve a direct restraint of interstate commerce; and despite Justice Brandeis' attempt in his dissent in the *Bedford Stone* case to apply the "rule of reason" the majority apparently leaves no scope for future modification of the court's conception of justifiability in these cases, for "restraint of interstate commerce," it said, "cannot be justified by the fact that the ultimate object of the participants was to secure an ulterior benefit which they might have been at liberty to pursue by means not involving such restraint."

In one respect the Clayton Act changed the position of labor for the worse; it put into the employer's hands the remedy of the injunction for injuries caused by restraint of interstate commerce. Previously that remedy had been available only to the government, and all the employer could do was sue at law for threefold

damages. The Norris-La Guardia Act apparently abolishes the federal injunction for conspiring to instigate strikes without fraud or violence, and it greatly limits the scope of the federal injunction in any labor dispute. It also removes many of the specific abuses which labor alleges have developed in the practice of issuing injunctions, such as the grant of temporary restraining orders on ex parte evidence for periods long enough to cripple a strike which may turn out to be entirely legal. Meanwhile the remedy at law for damages has been rendered somewhat more efficacious in the federal courts by the Supreme Court's declaration in the first *Coronado Coal* case [259 U. S. 344 (1922)] that unions although unincorporated are suable in their own names and "that funds accumulated to be expended in conducting strikes are subject to execution in suits for torts committed by such unions in strikes."

The law's concern with the internal affairs of unions is of growing importance. Through membership in his union a worker's real freedom may be greatly enlarged, but he must submit to such restraints as the union itself imposes on his liberty. The union is a miniature government and its rule may at times become oppressive. If so, the member's privilege of withdrawal may be of no avail to protect him, for leaving the union may involve loss of all occupation at his trade and in any event may leave him exposed to the restraints from which his union membership had freed him. His vote as a member is more important, and courts afford some remedy for dishonest elections. But votes are not always effective even when honestly counted, if the administration is firmly entrenched in power by the methods familiar in machine politics. How the law can remedy such a situation is not very clear. The law does give some relief, however, from the corrupt conduct of union officials in the handling of funds and from arbitrary action on the part of union disciplinary committees in the matter of fines, suspension and expulsion.

When a union succeeds in establishing a closed shop in an entire trade it is governing not only its own members but outsiders. If it excludes the latter from membership it is decreeing that unprivileged persons may not engage in a particular occupation. This it sometimes does on racial or political grounds or to maintain a higher scarcity value for the privileged labor. The writer is not aware of any instances where the law has interfered in these matters, although

the policy of exclusion may perhaps determine at times a court's position as to the justifiability of a strike for a closed shop or as to the validity of a closed shop agreement. If it will admit the outsiders to membership then it is merely making membership compulsory. Some courts object to this; on the other hand, it can be argued that if the union is a desirable organ of government then as with other organs of government all those who benefit from its functioning may properly be required to share in the burden of its support.

In passing on all these questions of labor law the courts frequently determine very delicate questions as to the extent and manner in which the distribution of economic power may be altered through the pressure of bargaining between employers and employees. While increased bargaining power on the part of employees will not remove the more fundamental legal sources of economic inequality it may at times be highly significant. The justifiability of its use in such cases would depend upon a judgment as to the justifiability of the particular inequalities which its use would diminish. Such a judgment would be conditioned largely by the economic philosophy of the judges where the question is not regarded as already settled by precedent. While the doctrines developed by the judges are not infrequently superseded by legislation, this legislation has to be interpreted by the courts. In the United States the Supreme Court has been severely criticized in labor circles for adopting the narrower rather than the broader interpretation of the language in the Clayton Act which legalized certain labor activities. The fault may well have been not so much with the court as with those who drew up the statute, but it has taken Congress more than ten years to enact a new law which would not seem susceptible of the narrow interpretation given to the Clayton Act. Even more significant to organized labor than the power of the courts to interpret a statute is their power to pass on its constitutionality. Judgments on constitutional questions also are necessarily the outcome of the general social philosophy of the judges; for a mere grammatical interpretation of the language of the constitution would not be decisive, and the judicial technique for reaching decisions as to what legislative interferences with the distribution of economic power shall be deemed to fall within the sanction of the vaguely defined "police power" is as yet, perhaps necessarily, crude.

The social philosophy of judges is thus a vital factor in determining how the law shall develop in the absence of legislation, how legislation shall be interpreted pending the enactment of new statutes and how far the legislature shall be permitted to alter the judge made law. The philosophy of the trial judge is also of vital importance to organized labor; for although his rulings, if erroneous in the view of the appellate court, are reversible they may decide the outcome of a particular controversy in cases where a reversal would come too late. Moreover the judge has wide discretion as to the finding of facts, the scope of an injunction and the granting or withholding of a temporary order on ex parte evidence. Organized labor has frequently used its political influence to prevent the election, appointment or confirmation of judges whose viewpoint it regards as unsympathetic. The most conspicuous instance was its participation in the successful attempt in 1930 to prevent the confirmation of the appointment of Judge John J. Parker to the United States Supreme Court. In this activity labor was following the example set in 1916 when the confirmation of Justice Brandeis was opposed, although unsuccessfully, by groups which feared that his social philosophy was not sufficiently conservative.

ROBERT L. HALE

Continental. The familiar contrast of characteristics which is based on the division of western law into Anglo-American and continental law is not extensively applicable to labor law. At present there is a much closer affinity between English and continental labor law. American labor law, which has undergone far less socialization than either, is set apart by its backwardness; it has simply carried to their logical extremes certain English developments, such as the law of conspiracy and the injunction, and the latter indeed remains its most prominent feature. In the treatment of labor problems much the same expedients have been tried in continental countries as in England and the United States. Examples of such attempts to fix wages as those represented by the English Statutes of Labourers may be found also in continental countries, where special servants' ordinances were a particular feature of legislation. The differences in the history of the labor law of the various western countries have been determined not so much by the invention of new expedients as by the selection from univer-

sally familiar ones. England as the country in which the industrial revolution first appeared simply showed the way.

In continental countries as in England the early relation between employer and employee was largely one of dependency on the part of the latter. The idea of relationship at the basis of the English law of "master and servant" is a general Germanic conception. Although slavery was known among the Germans, it was held not unfitting for a freeman to serve another; in cases of such service a relation of personal loyalty was established between them. The contract was one of faithful service. The duty of the retainer to serve his lord was not in itself contractual but arose from the established relationship, whence arose also a duty of protection and care on the part of the lord. Gradually, however, the basis of the service became contractual; the personal relationship receded into the background and the promise of service became the essence of the contract. The subjection of the servant to the master remained but it was no longer the basis but the consequence of service. Although the status of the servant class deteriorated progressively from the end of the Middle Ages, the old relational conceptions persisted.

Even the reception of the Roman law was unable to effect any considerable displacement of Germanic ideas. The Germanic law had developed many specialized forms of labor contracts which were well suited to the growing need for free labor, while the forms of the Roman law were ill adapted to it largely because they had developed in a slave economy. The Roman law had dealt with the labor relation as a form of lease. There was the *locatio conductio rei*, the letting of a thing; the *locatio conductio operis*, the letting of a job; and the *locatio conductio operarum*, the letting of a service; and the three forms were assimilated, although free labor was involved. The common law of the Pandects preserved the Roman doctrinal union of the labor contract with the hire of things, but in actual practise it was of little influence in most parts of Germany.

As in England and the United States the beginning of the nineteenth century witnessed the general recognition of the principle that the labor relation was to be regulated under the ordinary principles of contract. The French Revolution ushered in freedom of contract. Employer and employee were to be treated as equals. Yet the *Code Napoléon*, slavishly follow-

ing the Roman law, spoke briefly of a *louage d'ouvrage*, a letting of work, and a *louage d'industrie*, or a letting of services (sects. 1708-11). It had in all only two other provisions respecting labor relations. Article 1780 embodied a provision which had been part of the customary law of France since the seventeenth century to the effect that in any dispute as to wages or salary between a master and his employee or servant the master was to be believed upon his mere affirmation. This provision, which was not abrogated until 1868, must have been difficult to reconcile with the declared equality between employer and employee. The other provision, contained in article 1781, which related to an employer's powers of discharge, was also entirely in favor of the employer and was not modified until 1890. Modern continental legislation has in general regulated carefully the employer's powers of discharge and the employee's right to give notice.

The German regional codes of the late eighteenth and the nineteenth century completely rejected the Roman law conceptions of the labor relation. The Prussian *Allgemeines Landrecht* of 1794 was the first to do so. It treated the labor contract under contracts requiring positive acts (*Handlungen*) but contained few general provisions, following the Germanic tendency of regulating particular forms of labor contracts. The example of the Prussian code in rejecting the Roman law was followed by the Saxon code, the Austrian code and the Swiss Code of Obligations and finally by the German civil code at the end of the nineteenth century. It recognized two distinct forms of labor contracts, the *Dienstvertrag* (sects. 611-30), or contract of service, and the *Werkvertrag* (sects. 631-51), or contract of work. Its standards of protection of the worker naturally showed a considerable advance over the French civil code of the early years of the century.

Even as the nature of the employment relation was fixed by the ordinary law of obligations in the early decades of the nineteenth century, the liability of the employer for an injury to a worker was fixed by the ordinary civil law of wrongs. On the whole, however, the civil law of employers' liability (*q.v.*) was somewhat more favorable to the worker than the Anglo-American common law. The fellow servant doctrine was applied in Prussia but not in France under the *Code civil*. The latter, however, was not held to allow recovery for injuries arising from the ordinary risks of the work. On the other

hand, it allowed contributory negligence to go only to the measure of damages.

The parallel development of the law of combination in England and continental countries is particularly striking. With the decay of the guilds there had arisen associations of journeymen who sought to improve their lot by concerted action. A series of imperial ordinances were directed against them in Germany in 1530, 1548 and 1577, but they proved unavailing. The *Reichszunftordnung* of 1731 was more successful; it not only forbade combinations and strikes but provided (in this respect in a characteristically continental fashion) for police surveillance over migratory workers through a system of certificates of good conduct. The "labor book" was introduced into France in 1803 and spread through other European countries. The ordinance of 1731 was followed very closely in the German states. In France the guilds were dissolved after the revolution. In 1791 the Constituent Assembly passed the famous *Loi chape-lier*, which outlawed all combinations of masters or workmen and penalized strikes and lockouts. These provisions were codified in sects. 414-16 of the *Code pénal*, which had particularly great influence upon continental legislation.

The first half of the nineteenth century witnessed the general denial of freedom of trade association, while in the second half of the century the prohibitions were gradually relaxed or repealed. Saxony was the first German state to allow freedom of trade association (1861). The latter was recognized by the North German Confederation in 1869 and by the empire in 1872—subject, however, to important restrictions. The penal provisions against trade association were removed in France in 1864, but freedom of trade association was not proclaimed till 1884. The close resemblance between the combination law of France since 1884 and the combination law of England since 1875 has been pointed out by Dicey. It must not be supposed, however, that the recognition of the right of combination has been more significant on the continent than in England or the United States with regard to the removal of all limitations upon the actual conduct of labor disputes. General statutes against threats and intimidations have served much the same purpose as has the common law of conspiracy. Restrictive interpretation of the right of combination has been virtually a universal phenomenon. The law relating to strikes (*see STRIKES AND LOCKOUTS*) and boycotts (*see BOYCOTT*) must always be taken

into consideration. A feature of continental labor law which has been absent in both England and the United States (except for the ill fated Kansas Industrial Relations Court) is special industrial courts for adjudicating labor disputes (*see COURTS, INDUSTRIAL*).

Even before the second half of the nineteenth century there began in continental countries the general abandonment of the principle that labor relations were to be determined by the normal law of obligations. The general civil code provisions were supplemented by special provisions governing special types of labor contracts. These were sometimes contained in special laws relating to particular classes of workers or in supplementary general codes, such as the continental commercial codes. Most common were the industrial codes. Prussia enacted an industrial code in 1845, Austria in 1859. The industrial code of the North German Confederation of 1869 became the code of the German Empire. Most important in indicating a new attitude toward the labor relation was the legislation for the special protection of the worker which is described in the article on labor legislation. Such legislation was sometimes embodied in special statutes and sometimes in a general code. As a result of these developments the sources of continental labor law have become highly complex, while the multiplication of administrative orders has reduced them almost to chaos. Thus the functions of judicial interpretation with respect to labor subjects have been extremely important in continental countries, although not as important as in the United States. Continental courts, however, have at times tended also to exalt the provisions of the general civil and penal codes, which of course are not abrogated, to the detriment of special legislation. The general codes thus serve a function analogous to that of the Anglo-American common law.

The practise of codification is a special characteristic of continental law. Such codification has been made particularly necessary by the confusion in the labor law of the chief industrial countries. France has a *Code du travail et de la prévoyance sociale* of quite recent date; this is not, however, a really uniform labor code. Although continental codes are usually statements of an existing body of law according to some logical plan, the *Code du travail* is much more like an Anglo-American volume of compiled statutes, merely assembling under various heads the existing French statutes relating to

labor law. It is ultimately to have seven books, but so far only two have been published: book one in 1910 and book two in 1912; books three and four have been promised.

The labor law of Germany has been more advanced than that of any other European country with the exception of Soviet Russia. The basis of German labor law before the war was paternalistic; since the Weimar constitution important new institutions have been created, and the worker now enjoys by right privileges formerly granted as favors. Legal provisions have been made for employee representation. A new system of labor courts has been established, and the collective contract has been introduced as a flexible means of legal regulation of labor relations in any given industry. Such collective agreements have normative effects; not only do they govern the organizations which have concluded them, but their provisions become part of each individual worker's contract. The collective agreement may be said to be the very crux of German labor law; yet all notions of contract have not been abandoned, for it is laid down as a fundamental principle that there must be no compulsion on either side in the conclusion of the agreement.

The intensive development of German labor law since the war has led to its treatment as a special branch of juristic science. The new discipline of *Arbeitsrecht* has been cultivated by a growing number of German jurists, among them such men as Kaskel, Hueck, Nipperdey, Pott-hoff, Jacobi and Sinzheimer. The attempt is being made to work out a body of labor law upon fundamental principles, to reconcile existing divergences and to prepare the way for future legislation, especially for the uniform labor code which is envisaged by article 157 of the Weimar constitution. Thus far the existing provisions of German labor law have been admirably systematized. As to many fundamental principles, however, there is still no general agreement. According to the prevailing view labor law is conceived as the special law of the dependent wage earners. The concept of labor law does not extend to all the labor of men in society but is confined to a certain type of labor relation and must therefore be regarded as a purely modern branch of law. It is partly private law and partly public, since its content is determined not by subject matter but by the existence of a certain relationship. The most desirable method of regulating the labor contract has also led to divergence of views. It is possible to

regulate each form of labor contract separately or to make regulations which shall govern all forms of labor contracts. German legislation has not waited for all possible theoretical difficulties to be solved but has continued its own development. It is perhaps doubtful whether an entirely consistent system of labor law can be elaborated in any western democracy. The compromises dictated by the economic system are bound to be reflected in the principles of the labor law.

Yet principle is perhaps less important than might be supposed. The Soviet labor code of 1922 and the Italian charter of labor of 1926 are doubtless more consistent with the regimes which have established them, although neither the labor law of the communist nor of the corporative state is unique; both bear a startlingly close resemblance to that of such states as Germany and even France. The institution of the collective agreement has been introduced into all these countries since the World War, and their legislation for the protection of the worker has strongly marked common characteristics. Even compulsory arbitration is not to be connected solely with dictatorship. The labor law of the great European industrial states represents virtually a European common law. The actual differences in the conditions of the worker in the various countries is determined not so much by legal factors as by political forms and economic pressures.

LABOR, METHODS OF REMUNERATION FOR. The methods of remunerating labor in return for work performed may be classified according to the form of payment or according to the basis for measuring the amount of remuneration. In modern capitalistic society money is the principal form of wage payment. There have been periods, however, subsequent to the spread of coinage as well as antecedent to that development, when wages were paid in other media; as, for example, in kind, in services or in food, clothing and shelter. In other periods monetary compensation has been combined with other forms of remuneration. In such cases money wages have not always been the most important component of the compensation but have at times been merely supplementary to the provision of food, clothing and shelter.

In the economy of the ancient world after the development of coinage wages were paid partly in money and partly in commodities. The relative importance of these two constituent elements varied in general with the nature of the work, the period and the country. Throughout ancient history payments for agricultural labor were predominantly in kind; in urban commercial and industrial work, on the other hand, the monetary element in remuneration tended to increase in importance with time. By the fifth century B.C. workers in Athens were being paid chiefly in money; in Egypt, however, payments in kind continued predominant somewhat later than in Greece and Rome. The rise in the importance of monetary payments was not entirely regular and unbroken; in such periods as that of the debasing of the Roman coinage in the fourth century A.D. wage payments, like payments in general, reverted almost entirely to a barter form.

In the manor villages of the early feudal system the remuneration of labor, craft as well as agricultural, was characteristically in forms other than money: in protection, in the right to cultivate certain strips of land, in compensatory services and commodities. The development of commerce, the disappearance of the self-sufficient manors and the rise of merchant and craft guilds in towns and cities led gradually to payment in money in addition to other forms of compensation. Under the guild system industry was generally carried on in the master's house; the apprentices and even the journeymen generally comprised part of the master's household, and a considerable part of their compensation consisted of food, clothing and shelter provided by

the master. Here and there, however, apprentices and other workers were brought together under conditions which resembled modern loft factories. The wage system of modern capitalism with its emphasis on the cash nexus did not reach its full development until after the industrial revolution. The invention of power apparatus and the removal of work from households to factories made it no longer necessary or practicable for employers to accept the workers as part of their household, and the payment of money wages to a body of free laborers became the characteristic form of remuneration in capitalistic industry.

Yet payments in forms other than money have not entirely disappeared. In agriculture, domestic service, lumbering and similar extractive industries and in construction operations on frontiers, such as highway, railroad and power projects, bed and board and other necessities are supplementary forms of remuneration. When in such enterprises the relations of employer and employees are intended to be permanent, as in the development of a mine in an unsettled mountain region or of a cotton mill on an unsettled power site, the employer may build homes, establish retail stores and provide other community facilities for which nominal prices are charged, and these are rated as supplementary remuneration. In some instances, however, this payment in conveniences and "truck" may be equivalent to a diminution of real wages because of the excessive prices charged. In general these supplements to money wages are likely to be found today wherever industrial operations have called a considerable colony of workers together in a place unprovided with basic community facilities.

Somewhat different is a type of supplementary remuneration which is not necessitated by lack of basic community facilities but is added voluntarily by employers in socially developed centers. In a competitive money economy an employer hesitates to depart from the payment of customary wage rates by independent voluntary increases; yet because of a desire to secure the advantages of a low labor turnover and a productive goodwill he may be willing and able to give his workers certain supplementary satisfactions. Among these in addition to fair dealing and good management with the implied corollary of steady employment are exceptionally favorable conditions of ventilation, heat, light and cleanliness; rest rooms, cafeterias, gardens and playgrounds; dental and medical service; promotion and partial support of employee

clubs; classes for technical and general education; savings banks, group insurance and group investment organizations; accident, old age and unemployment insurance; and other types of welfare institutions. The term non-financial incentives to describe such provisions has taken a permanent place in management literature. Such types of welfare activity are, however, not always accepted whole heartedly by the workers, who in many cases would prefer an increase in their monetary wage to be disposed of as they themselves see fit. Organized labor, particularly in the United States, has opposed welfare work on the grounds that it leads to paternalism and autocracy on the part of the employer, suppresses the initiative of the workers and delays the progress of industrial democracy, divides the allegiance of the worker to his organization and in the last analysis operates at the expense of wages.

With regard to the classification of methods of remuneration according to the basis for determining the amount of money to be paid there are three principal types: the time wage, in which payment is for units of time (usually hour or day) without special regard for output; the piece wage, in which payment is for units of output without special regard for the time applied; and the efficiency wage, in which payment is for the degree of accomplishment of some predetermined standard, such as quantity per unit of time, quality, economy of materials consumed or combinations of these and other standardized factors. This customary classification is one of convenience rather than of strictly logical distinction. To hold his job a worker on a time wage must maintain some minimum quality, a worker on a piece wage must maintain some minimum output per unit of time and in all efficiency wage systems both time and output are major factors of the various formulae. From the point of view of the sharing of productivity these basic systems have different consequences. Generally the time wage system gives the advantages of improved technology to the employer, the piece rate system gives them to the employee and the efficiency system divides them in some ratio between the two. These generalizations are true only so long as no drastic changes are made either in the rate per piece or per unit of time. In addition under any wage system competition gives a share of technological advantages to consumers. The share of the increase attributed to the worker under an efficiency system is usually designated as his premium or bonus. The possibility of combining an almost infinite variety of factors in

constructing efficiency wage formulae has led to the devising of a large number, which are loosely and improperly labeled systems.

Both the time wage and the piece wage systems have long histories. They were a feature of the economic societies of Egypt, Greece and Rome, and as free labor emerged out of feudal institutions both of these systems returned to use. Where the tasks required of a worker were varied, as was usually the case, wages were paid on a time basis; but where the labor was for a definite task, such as weaving on a hand loom, the payment was sometimes based on output. With the development of the larger household industrial establishments and especially of the factory system following the industrial revolution, the time wage became the dominant system of wage payment.

About the third quarter of the nineteenth century a rapid increase in the size of factories and of their equipments created new problems of supervision of factory labor, which caused special attention to be turned to efficiency systems of wage payment. The only incentive system then known was the piece rate, but rapid extension of the use of this system was retarded by labor controversies resulting from the tendency of management to cut the piece rates in order to obtain some of the benefits arising from the advances in managerial technology. It was a period of great mechanical inventiveness, and the introduction of a new, more productive machine in a particular industry put those concerns which had piece rates at a disadvantage in competition with concerns having time rates, unless the piece rates could be proportionately reduced. A machine lowers costs of production where time rates prevail, but not where inflexible piece rates prevail. It was not until job analysis, with its standardization and specifications, became a part of managerial technology and made possible flexible and adjustable piece rates conditioned on the standard elements of operations that this wage system assumed its present status among forms of remuneration.

This early difficulty with piece rates stimulated search for some other form of wage payment which would have incentive value and yet give the employer a share of the advantage of increased productivity from the invention of a new machine and from improvements in operating conditions and methods. This led to the appearance late in the nineteenth century of a number of efficiency wage formulae. The first to be developed was the premium, or gain sharing,

system represented by the Halsey, Rowan and Towne-Halsey formulae, which established a standard based on the average of past performances; any savings resulting from the fact that a worker exceeded that standard output were divided between employer and worker on some empirical ratio. These premium formulae were followed by the Taylor differential piece rate and the Gantt task and bonus formulae, in which the standards were determined by experiment and time study measurements; by the Emerson efficiency bonus plan, which established standards less empirical than the earlier formulae but less scientific than those of Taylor and Gantt; and more recently by several scores of other formulae, which are only variations of the historic types already mentioned.

Both the Taylor differential piece rate and the task and bonus efficiency type of his assistant Gantt, which Taylor himself adopted as more manageable than the former, introduced a factor into the making of incentive wage formulae which has revolutionized the managerial environments in which wage systems have been applied and thereby indirectly so revolutionized all wage systems that the fundamental differences between them are disappearing. This factor is the scientific management principle of research determination of the standard or base from which differentials are computed. The earlier Halsey, Rowan and Towne-Halsey formulae had accepted job conditions as they were and utilized averages of past performance as the base. Taylor introduced the technique of painstaking experiment to improve the conditions and methods of each job and then used as the base the amount of time, determined by a stop watch, in which the job should be done under the improved conditions. This technique of stop watch measurement of experimentally standardized conditions has recently come to be used also in constructing nearly all efficiency wage formulae and in many instances in setting standards for workers on time wage rates. Piece, efficiency and even time rates based on time studied standard outputs per unit of time are much the same fundamentally, the differences being those of convenience in computation and application under particular circumstances. The essential difference between one wage formula and another has thus come to rest on the difference between the systems of management of which they are parts rather than on the mathematical characteristics of the formulae themselves.

Comparative data concerning the relative ex-

tent to which the different types of wage payments are being used are lacking. Wage statistics and a few sampling studies here and there indicate that generally throughout world industry the time wage is dominant, even in the most highly industrialized regions. In central and western Europe the piece rate has a strong position in many trades, as have both the piece rate and the efficiency types in the United States. In agriculture and most extractive industries, in the heavy unskilled work of manufacturing industries and in general wherever labor is called upon to perform a miscellany of jobs in the course of a day's work the time wage has proved to be the most manageable. In manufacturing establishments and in such extractive industries as mining, in which the unit of output is highly standardized and is measurably related to effort, the piece rate (including its contract rate variant) and the efficiency wage occupy an increasingly important place. The basis of payment is, however, seldom the same even throughout a single industry. In almost every time wage factory there are some pieceworkers and vice versa. A combination of four recent sampling studies of methods of wage payment in manufacturing industries in industrialized sections of the United States indicates (roughly, because the methods were not identical) that 40 percent of the wage earners covered were on time rates, 35 percent on straight piecework and 25 percent on premium or bonus plans. In the metal, clothing and footwear industries the percentage on piece rates was much higher than the average; and in the textile, food and printing industries the percentage on day rates was much the higher.

These studies show that the major position occupied by the time and piece rate systems reflects two important tendencies in industrial management: first, increasing use of standardization through time studied job analysis and, second, avoidance of the complicated formulae represented by premium and bonus plans in favor of the simpler wage systems. These tendencies, as has already been noted, are related. Given the control of operations made possible by thoroughgoing time study standardization, the simpler time and piece rate formulae can be given much if not all of the incentive value for which premium and bonus plans were devised. Provided standardized conditions are present and have been measured and valued, a time rate may be conditioned on a standard quantity and quality performance, just as a piece rate, a bonus or a premium is conditioned on a standard time of

performance. In some highly mechanized industries where machines in synchronized series set the pace of output one system of wage payment has no more incentive value than another. Therefore those systems which are the simplest for purposes of record and computation are preferred as other differences between the various systems tend to disappear. The stimulus which led to the devising of premium and bonus wage formulae was the desire to secure constant reasonable application of less strictly supervised labor energy and particularly constant maximum utilization of equipment and diminution of overhead costs and incidentally to win by money incentive an acceptance of the new methods of precise measurement and standardization in management. Wherever management through standardization has become familiar and acceptable to workers, the last element of the stimulus is no longer so important and the other two elements can be provided for by either time or piece rates.

The basis of remuneration, like the rate, has been a frequent subject of labor controversy. When first introduced the piece rate met with universal opposition from the workers, chiefly because of the employers' penchant for rate cutting. Although the attitude differs from industry to industry, organized workers are in general opposed to piece rates, especially in industries in which production standards have not been developed, as in the cloth hat, cap and millinery industries. Where production standards and a precise flow of materials have been properly developed, however, the piece rate is more generally acceptable. Experience with bonus and premium plans has been much the same. Early opposition to them was largely based on a failure to understand the complicated formulae and the fear that they concealed opportunities for rate cutting similar to those offered by the piece rate method. Where production standards have been developed, these types also have come to be accepted. On the other hand, where carefully studied production standards do not exist and standards and premium ratios are arbitrarily imposed, as in many textile plants of the southern states, efficiency plans of wage payment meet violent opposition. Controversies involving the basis of wage payment as an issue generally have as the more fundamental issue distrust of the intentions and competence of the management. Where careful organization and standardization of operations and a definite policy of industrial relations are present the wage arrangement,

whatever basic type it may represent, can be effected without controversy because the facts of the situation are understood by both parties to the negotiation and the employer's desire for high production and low costs can be reconciled with the workers' desire for adequate earnings, proper conditions of work, absence of discrimination and fair dealing generally. Where these prerequisites are absent and the management is inspired by a policy of opportunism in which the commodity theory of labor plays a strong part, workers feel that their interests are best conserved by the simple time wage. The interest of consumers as represented in the quality and price of output is little affected by the method of wage payment as a factor distinct from the method of management. No wage system per se can bring price and quality under control; on the other hand, competent management can bring them under control with any system of wage payment, although the piece rate and efficiency systems make the task easier. It is at this point that the "non-financial incentives" which are always created by competent management play an important part.

The group bonus, a recent addition to the methods of wage payment, is in principle identical with the individual bonus or premium. The growing favor which the group bonus as compared with individual bonuses is receiving from managements is due to the relative simplicity of the records and computations involved and to the fact that it stimulates within the group a co-operative self-supervision. Where group work is carefully organized and standardized and the members are carefully selected, the method works very well because cooperation is emphasized; but when such care has not been exercised, the cooperation may become transformed into a ruthless policing of the weak by the strong members of the group with resulting ill will.

On the executive and distributive side of capitalistic industry the principal method of wage payment is the time wage. Executives receive annual salaries, and clerical workers in both offices and merchandising establishments generally receive a monthly or weekly wage. In a few instances office employees are remunerated by bonus plans on the basis of measured output, but this is exceptional because of the difficulty of measuring clerical work. Sales people usually receive commissions based on volume of sales in addition to a stated time wage, the commission usually forming all or the greater part of the remuneration in the case of manufacturers' sales-

men and persons selling such services as insurance but less frequently in the case of retail sales people. Supervisory personnel may sometimes receive in addition to a time wage a commission or bonus on the earnings of those whom they supervise. In some enterprises profit sharing (*q.v.*) is an additional form of remuneration for the executive group, but its application to the rank and file of workers after some experiments in that direction has practically been abandoned. Employee stock ownership can hardly be classed as a form of remuneration for labor, inasmuch as the income is from investment; bonus elements are present, however, where the stock is made available at a preferred price or given outright or where special privileges are afforded in the method of purchase.

What the forms and bases of remuneration for labor would be under a regime of pure socialism or communism which would utilize modern technology, particularly specialization and division of labor, is wholly speculative. The various experiments with communistic settlements (*q.v.*) have generally employed the principle of equal claims by all members upon the income of the community, with distribution in the form of food, clothing and shelter out of the common store. In the attempts which have been made at producers' cooperation (*q.v.*) payment has consisted in the last analysis of the share of the individual worker in the profits of the enterprise, distributed partially in advance in the form of more or less regular wage payments and partially in the form of dividends or an equal share in the increased value of the establishment. Where, as was frequently the case, outside labor was utilized by these communistic settlements and cooperative enterprises it was generally paid in the form and on the basis prevailing outside the enterprise.

Such communistic settlements and ventures in producers' cooperation have been neither sufficiently large nor sufficiently influential to affect prevailing methods of remuneration for labor; they have generally tended to disappear eventually or to become absorbed into the dominating capitalistic environment. The industrial regime of the Union of Soviet Socialist Republics, however, with its ultimate aim of establishing a thoroughly communist society based on an industrial mechanized economy rather than on a simple agrarian economy is of the greatest significance, even though its present forms of organization and of remuneration may not be final. Speaking broadly, all citizens are workers be-

longing to one or another functional class as employees of the collective whole, which owns the instruments of production and through its agencies conducts the processes of industry and commerce. The remuneration of the workers is of three kinds: money wages, based predominantly on time and piece rates, varying according to the grade of work but without a wide spread between the highest (executives) and lowest (unskilled) and including also certain special or collective bonuses for increased efficiency awarded to groups of workers engaged in directly productive work; collective remuneration in the form of socialized services, such as education and training, recreation facilities, medical care and other welfare attention, housing and various types of insurance; and special privileges accorded certain categories of workers, such as preference given manual over intellectual workers in the matter of housing accommodations and retail purchases. Money wages paid in Soviet Russia are not easily comparable with those paid in capitalist countries, because so large a proportion of the Russian workers' remuneration is in non-financial socialized forms. The tendency seems to be toward increased emphasis upon payment on the basis of results and an increasing divergence between the compensation of different strata of workers. The presence of so many incalculable elements in the Russian situation makes it impossible to foretell what forms and bases of remuneration will ultimately prevail and whether eventually the communist ideal—"from each according to his ability, to each according to his need"—will be realized.

LABOR MOVEMENT is the term which is used to designate all of the organized activity of wage earners to better their own conditions either immediately or in the more or less distant future. In all countries it has run along three lines—political, economic and cooperative. These have not been parallel but have alternated in predominance in the same country or have predominated differently in different countries according to differences in institutions and economic conditions.

Essentially the labor movement implies the existence of a wage earning group, but it does not appear until that group develops some consciousness of the separateness of its interests as opposed to those of its employers and until it realizes the necessity for some form of organization in order to advance these interests. Its earliest time limit must be sought in the period of capitalism, when the free wage earner replaced the bound serf of feudalism. The labor movement is always a reaction and a protest against capitalism.

But capitalism is not a single or static concept. It is an evolutionary concept of three historic stages—merchant capitalism, employer capitalism and banker capitalism. The first arose out of the extension of markets and the second

out of technology; the last is now dominant as a result of the prevalence of the credit system. Labor movements reflect these capitalistic movements.

Different industries move at different rates of speed toward final consummation. In the merchant capitalist stage the wholesaler aided by the rising commercial banker dominates the access to distant consumers, while the producers are scattered in small shops of masters, mechanics, apprentices and helpers. The employer here is himself a mechanic contracting to deliver the finished product to the merchant capitalist, who owns the raw material, while the contractor owns the shop and the journeyman the tools. This is the sweatshop system of production, because the merchant capitalist sets the contractors to competing with each other and with homework, prison work and foreign producers, so that their profit as employers comes mainly from the "sweat" of the workers. The building trades are the typical lag from this stage of capitalism; in the case of agriculture this stage survives in the middleman system.

In this merchant capitalist stage arises the revolutionary philosophy of Proudhon's anarchism for industry and cooperative marketing for agriculture. If a social philosophy means a certain view of human nature and a goal toward which a movement is directed, then the philosophy of anarchism is that of individual property of small producers with voluntary cooperation to displace the middleman as the goal. The anarchist philosophy does not abolish private property—it proposes to make it universal for each individual, conforming to a stage of industry where the contractor owns the shop and the peasant the farm. The small proprietor who works with his men is idealized as a competent business man who could succeed in bargaining cooperatively if the great middlemen and their banking affiliates did not have monopolistic power granted by governments. This is indeed the philosophy of the small capitalist, the *petite bourgeoisie*; and it is not surprising that after a similar revolutionary movement of wage earners has arisen under the name of syndicalism the petty capitalists of this stage, unable to combine cooperatively, should combine politically under the banner of Fascism to dominate the big capitalists and bankers on the one side and the revolutionary wage earners on the other.

It is in this stage of merchant capitalism that trade unionism also emerges. The trade union is originally a union of the journeymen or

skilled mechanics working in the small competing shops of the petty employer. They eventually abandon cooperation and the other ideals of anarchism and devote their energies to strengthening their bargaining power. At first the unions are confused about the economic position of this petty employer who works along with them and is today a journeyman, tomorrow a contractor and employer. They admit him to membership because his economic interest is that of a wage earner; then they exclude him because his interest is with the capitalists, for whose profit he hires the wage earners. This is the stage of craft unionism which excludes helpers and unskilled workers and endeavors to control apprenticeship and maintain the "union shop" or "closed shop" for the sake of increased bargaining power. The philosophy is that of the skilled mechanic, who has "invested" years of low wage apprenticeship for the sake of an established position and a higher standard of life and yet sees himself unemployed and brought down to the level of the lowest by their competition. It is the stage of trade unionism which began in 1850 in England and the United States and of the Hirsch-Duncker unions organized in Germany twenty years later.

When the employer becomes the capitalist by owning the machinery and factory as well as the goodwill which formerly belonged to the merchant, when the contractor moves into the factory and becomes the foreman, when the skilled mechanic by specialization and machinery is reduced toward the level of the unskilled, then capitalism becomes employer capitalism and laborism tends to become communism, syndicalism, guild socialism or industrial unionism. Karl Marx saw this stage in England after the middle of the nineteenth century and predicted it for the world—the technological stage of capitalism on a wide scale, made possible by the preceding extension of markets under merchant capitalism. This is the stage of the organization of the unskilled beginning in the 1880's with the Knights of Labor in the United States and with the dock workers, gas workers and general laborers in England.

The wage earners as such cannot wait upon a reorganization of society or upon political action for jobs and food. If the reorganization comes suddenly, under the leadership of a Lenin in the midst of world war, they may fall in line, even though the ripened employer capitalism for which Marx would have had them wait has not yet appeared. Their strikes are at first

blind protests; and, although they are thereby unemployed, it is an unemployment concentrated by their own will and not staggered through the years at the will of their employers. Then if successful they acquire "business" leaders, who by placing the agitational leaders in subordinate position negotiate with the employers for the best terms obtainable under the existing institutions of property and liberty. This is the collective bargaining and trade agreement stage of unionism.

Whether the unions turn out to be craft or industrial depends on the capitalistic stage of the industry and the class solidarity of the workers. If they are divided by language, religion, politics, skill, color, race or geographical sections, as in the United States, there must be built up an artificial solidarity, which reaches only the few who can lift themselves above the mass into craft unions. If they are driven together by a history of common subjection to a military, aristocratic, ecclesiastical or proprietary lordship, as in continental Europe, they fall into the widespread solidarity of class struggle and a powerful socialist political party. But if this solidarity is the result of the advance of the employer capitalist, then they vacillate between industrial unionism and socialist parties.

Thus the two goals which divide labor movements are displacement of capitalism and bargaining with capitalism. Displacement takes the form of voluntary cooperation primarily through producers' cooperatives (although consumers' cooperatives also had this aim at first) or the compulsory form of politics, communism or syndicalism. Bargaining with capitalism is unionism. But these goals are not inseparable. They follow a time schedule. In periods of rising prices, of increasing profits and growing demand for labor bargaining with capitalism predominates, because employers can afford to pay and unemployment has no terrors. Revolutionary political activity and socialist utopias are abandoned for the immediate and real gains achieved by union organization. Such political demands as are made deal with the interference with labor's freedom to organize and act on the economic field. In periods of falling prices, of decreasing profits and unemployment the displacement of capitalism predominates as the goal, because capitalism cannot furnish employment and its burdens are actually relieved by unemployment. Political activity, communist agitation and quasi-revolutionary strikes replace

the "business" strikes of unionism. Socialist and communist parties poll large votes and plans for a reorganization of society on a non-profit basis receive serious consideration by unemployed and partly employed workers as well as by radical intellectuals and others.

The period of banker capitalism is the modern variation of Karl Marx' theory of the ultimate concentration of all industry. During the nineteenth century the commercial banker with his short term credits was typical. During the twentieth century the banking syndicates or the investment bankers have risen to a dominant position in the consolidation of industries, the sale of securities and control of boards of directors whose corporate securities they have sold and for which they have become substantially responsible. Millions of scattered investors now automatically organize themselves by transferring their savings to securities floated by trusted bankers.

Labor movements now face a new problem and take on a puzzling new formation. No longer are they dealing with the master workman or the small contractor or even with their own factory managers; they are confronted with an invisible army of investors and speculators led by an invisible syndicate of bankers. Through international affiliations the syndicates are world bankers. A nation, a section of a nation, a restless locality, a labor government, a labor party or a labor union which jeopardizes the credit of its immediate employer thereby shuts down the latter's establishment and transfers employment to other nations, other sections, other employers. In the face of this situation of the twentieth century all labor movements except in Russia seem to be helpless and their leaders despondent. Perhaps returning prosperity will change the situation and reestablish a militant unionism seeking to restore the rights taken from it during the depression, or it may be that labor movements will be relegated to the history which now shrouds the guilds of the Middle Ages or that craft unionism will turn to industrial unionism or communism. Yet many enduring effects remain. Labor movements make a new class alignment unknown to history. Before the industrial revolution it was inconceivable that an unpropertied class could have a permanent interest in the commonwealth. Now, whether it be explained by a higher ethics or merely by the incoming of machine technology, this proletariat by strikes, revolutions or dangerous unrest forces its way into fuller citizenship.

Contrary to previous assumptions the free worker has been found to be individually more efficient than the servile worker. This efficiency, however, is acquired at the cost of unemployment. In the small industry or agriculture of the merchant capitalist stage the worker could obtain at least food, heat and shelter when unemployed. But in the banker capitalist stage the culmination is reached of a huge urban and factory population unprovided with even these minimum necessities of life except through the money wages which stop when unemployment sets in. The political and economic menace of an unpropertied population removed from the soil yet enfranchised grows with the development of the factory system and long distance transportation. In general the degree to which the older institutions of property, liberty and representative government are menaced correlates with the extent to which a non-propertied class has displaced the propertied classes in politics.

The cycles of overemployment and unemployment have doubtless been the main cause of the characteristic movements of this non-propertied class. Marx' prediction of the decay of capitalism rested mainly on the use made of the "reserve army of the unemployed"; and the authorities of Soviet Russia boast that by overthrowing capitalism they have eliminated unemployment, although they admittedly have low wages. But the unemployment which Marx had in mind was the chronic unemployment of displacement by improving technology, whereas the cyclical unemployment which alternates full employment with unemployment is much more serious. In prosperous times and in periods of inflation, when prices are rising and profits augmenting, the employers compete for labor and they readily raise wages far above the hopes previously entertained by the workers. In the deflation period, when profits begin to disappear, the daily rates of wages are not immediately reduced but the laborers are laid off.

This cyclical variation from prosperity to depression has a profound effect upon the psychology of laborers. In the period of full employment there is no pressure upon them to exert themselves, because they can quickly get other jobs at higher wages if they are discharged. They are careless of machinery, they abandon their trucks on the streets, they are insubordinate. But in the period of unemployment hunger drives them to speeding up, to longer hours per day, to lower wages per hour, to submission.

They are first demoralized, then pauperized, then coerced.

Trade union policy follows this cyclical experience, while Marxian socialist policy more nearly follows technological unemployment. In a period of returning prosperity the unemployed are first taken on without a raise in wages; they must work longer hours and at higher speed. Then, as full employment approaches, it becomes easy to organize; the first demands are for shorter hours and, as the cost of living rises, for higher wages per hour. This is the typical although not the universal procedure. In 1897 at the close of the long period of unemployment the membership of all American unions was only 447,000. By 1900 with returning prosperity the membership had risen to 868,500. In 1920 with the post-war prosperity the membership rose to 5,110,800. The unemployment of 1930 and 1931 reduced it to about 3,000,000. Similar changes have occurred in other countries.

Yet like communism trade union policy is based on the philosophy that there is "not enough work to go round." Although opponents charge that they aim to restrict output, many union policies are really designed to ration among the members the limited amount of work. Most restrictive working rules look toward the elimination of job scarcity and the creation of greater job opportunity and security of tenure. Thus the closed shop is a prime necessity where the union is in danger of being undermined by the presence of non-unionists. The number of apprentices is limited in order to limit the present and future number who must share jobs. The railroad unions concentrate on strict seniority rules which in time of prosperity insure to the union men an equal chance of promotion and in time of depression give the older unionists a chance to preempt jobs of lower rank before losing their work entirely. The eight-hour day and the forty-hour week are advocated, whether by legislative or union action, not only on the ground of fatigue and leisure but mainly to share the work with the unemployed. Labor movements concentrate attention on the rate of wages per hour rather than on the earnings per year, because they cannot see steady employment ahead. During the second and third decades of the twentieth century they begin to demand unemployment insurance despite the evident fact, which they recognize, that full wages for employment are better in every way than part wages while unemployed. It matters not whether the avowed goal is displacement of

capitalism or bargaining with capitalism—all agree on a policy substantially based on the experience and fear of unemployment.

These policies go further. In view of the uncertainty of employment the older virtues of thrift, on which Smith's capitalism was built, lose their appeal and give way to the demand for a higher standard of living in the immediate present. While the peasant or farmer or small business man denies himself present enjoyments to accumulate for "a rainy day" or for old age or children, hoping to retire from business in comfort, the so-called high standard of life of the bulk of wage earners is present enjoyment of everything available, including present education of their children, by means of high wages for current work. The working man who saves and then sees his savings lost or his home foreclosed becomes a butt of ridicule for the others who enjoyed their wages while they lasted and are still as well off as the thrifty when wages stop. The philosophy of labor movements becomes the immediate present, for tomorrow is beyond the worker's control.

This explains somewhat the changes of leadership in labor movements and their fleeting affiliations with the disappearing peasants and farmers. What mortgages are to the latter, unemployment is to the former. The mortgages in periods of depression precipitate the farmers into the proletariat of tenancy or wages; then unemployment masses them into wage or class consciousness. In the earlier stages of labor movements and in periods of business depression there is a loose affinity between laborers and small farmers. Each has the merchant capitalist to deal with or in the more feudal countries the affiliated landlords and capitalists. The issue then is between the rich and the poor or aristocracy versus democracy, where later it becomes the issue of wages against rent, interest and profit. In this earlier stage the so-called intellectuals, or intelligentsia, are the natural leaders, for they have a formulated social philosophy and an ability to articulate what the others feel but cannot tell. This is the stage of Marx, Lassalle, Lenin, Powderly, Louis Blanc or Proudhon. Their counterparts survive and come forward in periods of depression, when workers and farmers are desperate, and they retire when aggressive organization, routine and a chance of success call forth leaders from the rank and file, like a Gompers, an Applegarth, a Legien, a Jouhaux.

It is often represented as unfortunate that

labor movements reject these intellectuals, for they need the broader social viewpoint and the scientific mind of the intellectual. But this is a confusion of the leader with the expert. As a leader the intellectual looks to the distant future of a reorganized society. But the wage earner is deeply concerned with his job now. If the intellectual takes his proper place, as he does in all business organizations, not as a leader in forming policies but as a technician in details and an adviser against mistakes, labor organizations begin to use him. This seems to be the case in all ripened labor movements. And the expert is increasingly needed as the new world wide strength of banker capitalism threatens labor movements which have been organized along the older lines of action.

The intellectual has been employed by the labor movement especially in those of its auxiliaries which supplement and implement the political, economic and cooperative activity. Such, for example, is the labor press, manned to a considerable extent by intellectuals who, as in England, have become attached to the movement from the outside or who, as in America, have largely risen out of the ranks of organized labor itself. Another auxiliary activity in which greater reliance has necessarily been placed upon the "outside" intellectual is that of workers' education (*q.v.*). But even here there are strong groups, as in the National Council of Labour Colleges in England, which oppose the use of university trained intellectuals to teach workers' classes; even the English Workers' Educational Association pays lip service at least to the ideal of developing out of the workers' classes themselves a competent body of teachers for these classes. Another growing use of the university trained intellectual is in the research bureaus which are connected with the important central organizations in the larger countries and with some of the more important individual unions.

It must be noted, however, that the intellectual as a "worker by brain" may be forced to join the trade union movement to seek the security he can find nowhere else. Thus in France the greatest increase in unionization since the World War is among public employees, and in the United States the only important gains in membership in 1931 were among federal employees. Unemployment among the professional and white collar workers brings them closer to a realistic view of the labor movement.

There is especially one kind of appeal, the

nationalistic, wherein the intellectual and the rank and file leadership come clearly into conflict. The intellectual is likely to be a cosmopolitan, a pacifist, who sees the working men of other countries subjected to similar capitalists, but the rank and file are dependent on their own employers for jobs more than on the solidarity of the workers of the world. It may be and doubtless will be more oppressive for them if a foreign nation conquers both them and their employers than it will be if they reach an understanding with their employers jointly to fight the foreigner. In Germany the rank and file leadership in the face of a Marxian world philosophy accepted the nationalistic appeal and brought many of the intellectuals with them. The heavy burden placed upon German industry after the war showed that they were right.

In other countries a similar appeal can for similar reasons be relied upon to draw or coerce the wage earners away from their labor movements into collaboration with their employers. In capitalistic nations as in aboriginal tribes the whole population is at war. Warfare is not an aristocratic profession of a military class suppressing the workers at home and whole populations abroad; it is the people in arms. These become mainly wage earners, producing munitions in the rear and carrying them forward to the front and manipulating modern war machines. A new problem is presented of creating loyalty among those who have little or no property to defend, with the result that in the crisis of foreign war the labor movement is more powerful in its wage bargaining than in time of peace.

Yet national wars accentuate a new division, which has its prior economic foundation in the expansion of capitalistic industry: the separation of manual workers from technical, office, professional, educated and social workers. Large scale industry and merchandising push the latter miscellaneous class into a new alignment making these groups more or less conscious of their common interest. They take the place in the social organization formerly occupied by small independent proprietors, and with the remnants of the latter they form that third minority group which appears under different names and affiliations in different countries as progressives, liberals, Fascists, nationalists or war veterans. Instinctively separated from the manual workers yet not quite identified with their same capitalistic employers, their

growing class consciousness and sense of strategic position make them more or less able to turn the scale between capitalism and laborism. The strength of this group in the ripening stages of capitalism cannot be measured by inadequate occupational statistics, for although they are evidently a minority yet under capable leadership they are able to command concessions or to dominate situations.

Somewhat similar to the nationalistic is the religious or ethical appeal, which deters wage earners or softens their aggressive labor movements. The Catholic church in closer contact with manual workers and backed by the papal encyclicals, which have taken over the doctrines of the earlier Christian socialism, has devoted itself with varying success to this cause. The Protestant churches, by historic tradition the inspiration of individualistic capitalism, have not been able to appeal to the new class of wage earners; while the Russian Orthodox church, long since the acknowledged instrument of czarism, has apparently lost its hold in the face of a revolutionary materialism. Even the Catholic unions of Germany have begun to make common cause with the socialistic unions.

It is difficult to give due weight to the ethical motives which have descended from the religious training of the past. Perhaps it should be said that the ethical appeal is becoming an economic appeal and takes such form as "business ethics," "trade union ethics," "communist ethics," which confessedly spring from economic conflicts with the rise of various forms of concerted action designed to bring under control the individual behavior deemed contrary to a common interest. While the earlier guilds and unions had their patron saints, these modern associations make similar ethical rules unsanctified by religion.

To counteract the improvidence of an unpropertied class many devices for thrift and savings have been instituted. It is evident, however, that wage earners as such only meagerly or temporarily participate in them. The patrons of savings banks in the United States derive their incomes largely from sources other than wages. Cooperative home ownership, known in the United States as building and loan associations, is an effort to obtain what for the wage earner is the dubious advantage of tying himself bodily to a precarious investment, when mobility is of more substantial advantage in obtaining employment and higher wages.

Distressed by this mobility and improvidence

employers attempt with scant success and to a limited extent to set up schemes of profit sharing, stock ownership, home ownership, garden cities, credit unions—a sort of compulsory thrift because preference is given to those employees who participate. In the beginnings of unemployment insurance agitation this compulsory thrift was imposed upon wage earners by legislation, requiring them to contribute to funds when employed in order to provide part wages when unemployed. Most of these schemes turn out to be inadequate and even productive of class feeling when the wage earners reach a substantial proportion of the population. It is indeed somewhat of a mockery for propertied classes to endeavor to impose on the unpropertied and potentially unemployed the older ideas of thrift carried over from the infancy of capitalism.

England was the first nation to embark on that great process of economic change which brought about modern capitalism, and its labor movement was the first to have a gradually growing but distinct working class viewpoint. The coming of industrialism resulted at first in various movements of protest, which expressed themselves in such ways as the machine breaking of the Luddite rioters and in demands for land reform, so that this working class, essentially rural in origin, might have an opportunity to return to the land and to escape from the evils of industrialism. The collapse of the Chartist agitation in 1848 marked a new period in the English labor movement, in which industrialism became accepted as an established fact; the workers no longer looked to some ultimate escape from the factory system but sought merely to ameliorate their position in that system. Aided by a period of prosperity, which came to be known as the "golden age of English capitalism," trade union organization developed after 1850, following the so-called new model introduced into the building trades, and spread to other fields through the activity and influence of an important group of trade union leaders known as The Junta. The new model unionism was a craft unionism which believed in more thorough centralization in union organization and greater cooperation with the employers and disavowed any rashly militant strike policy. With prosperity and better tactics it flourished until the depression in the late 1870's, which revealed the limitations of a type of unionism restricted to skilled workers.

The late 1880's therefore saw a development

of large industrial unions of unskilled workers among the miners, dockers, gas workers and general laborers. This "new unionism" was led by a group of socialists and was more class conscious than the earlier unionism. But despite the efforts of Keir Hardie and the Independent Labour party which he organized in 1893 the idea of independent political action by labor in contrast to the policy of supporting left wing Liberal candidates, known as Lib-Labs, was not abandoned by the trade unions as a whole until 1899. With the organization in that year of the Labour Representation Committee, which became the Labour party in 1906, the English labor movement secured a political wing which contrary to the situation on the continent was practically created and actually dominated by the trade unions. The Labour party was Fabian and not Marxian in its social philosophy and did not officially accept socialism as its philosophy and program until 1918. Contrary to the situation in Germany, where the trade unions had to struggle to escape from the domination of the Social Democratic party, the Labour party in England has struggled, although as yet unsuccessfully, to establish its independence of the trade unions.

These two essentially British types of labor activity—business unionism and a reformist non-revolutionary labor party—were challenged before the World War by a type of labor philosophy which came from France. Syndicalism with its opposition to both political action and collective bargaining and its emphasis on revolution through a general strike took a strong hold on the British labor movement before the war, as it did in the United States, Australia and New Zealand at the same time. In a country unaccustomed to revolutions, such as England, a modified syndicalism under the name of guild socialism pictured an economic organization of the state with the business man eliminated but with the technical engineers sharing power equally with the workers in a new constitutional government. The transition to the new system was to come peacefully and gradually through the extension of workers' control in the shops. This served to modify the English brand of socialism, which now began to look upon government ownership as dictatorship and to take over the guild ideas of an economic parliament. By the end of the war the movement had grown so strong that large scale experiments in its application, especially in the field of building, were attempted. The failure of these involved the dis-

integration and disappearance of the guild socialist movement.

The post-war labor movement in England has been seriously hampered by the economic stagnation from which the country has suffered since 1920. One characteristic result of that situation has been the decline in union membership and the weakened power of the unions. The unions have made strenuous efforts to resist concerted downward movements in wages and conditions of work. The most heroic of these efforts, unique in modern British labor history, was the general strike of 1926, called by the Trades Union Congress to protect the miners from an attack on their conditions of work, an attack which the congress regarded as a forerunner to a general attempt to lower the standard of living. The general strike idea had haunted the working class movement ever since the days of syndicalism and labor unrest before the war. But in the minds of the English workers it was by no means an essentially revolutionary idea. The basis of its appeal was a feeling that all the workers were subject to the same changes and that all must stand together in meeting them. The failure of the strike resulted in the passage of the Trades Disputes and Trades Union Act of 1927, which declared illegal all sympathetic strikes; in a strengthening of the Labour party at the expense of the trade unions; and in an increased emphasis on class collaboration as represented by the Mond-Turner conferences, which promised far reaching changes in English industrial relations until the opposition of the conservative employers nullified the work of the conferences.

The rapid rise of the Labour party to the point where it first displaced the Liberal party and twice (1923-24 and 1929-31) formed minority governments has been one of the outstanding features of the post-war British labor movement. The party has shown an inability and an unwillingness to use its strength to introduce definitely socialist measures. The crushing defeat which it suffered in 1931 was of some value in definitely eliminating from it the party elements which were essentially liberal rather than socialistic (see LABOR PARTIES).

Karl Marx' socialism was based on the factory system of England and was inapplicable to the merchant capitalism of the continent. Except for a brief spell of union organization after the Revolution of 1848 there was no labor movement in Germany until Ferdinand Lassalle issued his *Open Letter* in 1863. Lassalle's program

was quite different from that of Marx. Marx favored confining labor organization mainly to the economic field, proposing an international organization of labor to overthrow capitalism in all countries. Lassalle, on the other hand, sought to develop a political organization which would obtain universal suffrage in Germany for labor and then through control of the state subsidize workers' producers' cooperatives by state credit and taxation. His program ruled out trade unions and voluntary cooperatives, because each would be ineffective on account of the "iron law of wages."

Following these two divergent philosophies there developed in Germany a Lassalleian political Allgemeiner Deutscher Arbeiterschaftsverband and a Marxian group founded by Bebel and Wilhelm Liebknecht in 1868. In 1875 these two combined to form the German Social Democratic party; the consolidation permitted the unification at the same time of the socialist trade unions. The Lassalleian philosophy, however, dominated the German labor movement at the time. The antisocialist law of 1878 outlawed all kinds of unionism; when that law was discontinued in 1890, Marx' socialism was the dominant philosophy of the labor movement.

The trade unions, some of which had managed to exist after 1878 despite the restrictions and many more of which were organized after 1890, were subservient to the growing Social Democratic party. Under the leadership of Carl Legien, however, these unions gradually developed a philosophy and technique of their own. By 1906 they had obtained equal status with the Social Democratic party; and the check suffered by the latter in the election of 1907 solidified the position of the unions and converted the Social Democratic party, at least in practise, from a Marxian to a revisionist policy.

This continued until the World War, when both the trade unions and the political party supported the government. Unionism gained in influence and status during the war. It obtained joint boards of employers and employees and representatives on many government boards. Its crowning success came with the revolution in 1918 and the incorporation in the republican constitution of the status obtained by the trade unions in 1918 through a national agreement with the employers which granted full recognition; abandonment of "yellow" or company unions; abolition of discriminations against union members; the eight-hour day; shop committees; joint conciliation boards and joint adminis-

tration of employment bureaus. The power of the unions showed itself in their ability to defeat by a mass general strike an attempted reactionary *Putsch* in 1920. The development of a strong Communist party in Germany out of the Independent Socialist party, which broke away from the Social Democratic party in 1916 over the issue of supporting the war, has split the labor movement in Germany. The universal opposition between communists and socialists has been aggravated in Germany by the memory of the bloody repression of the Spartacist revolt of 1919 by the socialist controlled government. The Social Democratic party, which despite the fact that the communist movement shows greater political strength in Germany than in any other country outside of Russia was the largest single party in Germany until the election of July, 1932, has turned to the Catholic Center party, the Liberal Democratic party and the People's party for coalitions. Since 1929 the National Socialists, or Fascists, under Hitler have become the most formidable opponents of both unions and Social Democrats. Predominantly a middle class movement, Hitlerism has attracted many workers disappointed with the results of the revolution and has enlisted the support of many large industrialists and landlords who hope to establish a dictatorship to protect their profits and rents. The growth of this movement, with its avowed purpose of suppressing trade unions, socialists and communists, constitutes the most serious threat which the German labor movement has faced since 1878.

The labor movement in France before the World War presented a definite contrast to the English and German movements of the same period. Union organization in France dates practically from 1884, when the most important changes were made in the restrictive laws concerning labor organizations. But a definite subserviency to the socialist movement, itself divided into a number of groups, hampered the functioning of the unions. The organization of the *Confédération Générale du Travail* in 1895 initiated the development of a peculiar syndicalist labor movement, which disavowed the political actionists and the trade unionists. Its philosophy was formulated by Sorel at the beginning of the twentieth century. Its weapon was the sudden or general strike, whose object or tactics was to take over the factories or farms by "direct action"; to repudiate collective bargaining, or "collaboration with capitalism," which had been the goal of trade unionism; to have the fac-

ories or farms operated by an idealized working man turned business man; and to displace the state by an economic cooperation of "production for use" and not for profit. This philosophy of working men who were disillusioned by politicians disrupted the socialists and spread to many countries; it became the dominant characteristic of the labor movements in the Mediterranean countries.

The amalgamation in 1902 of the *Fédération des Bourses du Travail* and the *Confédération Générale du Travail* unified the economic side of the labor movement in France, but it resisted all attempts of the socialists to control it and in 1906 after a series of successful militant strikes it adopted in the *Charte d'Amiens* a definite statement of political neutrality. The coming of the war, however, shattered the non-political antimilitarist principles of the *Confédération Générale du Travail*. It supported the war, permitted its leaders to serve in the cabinets of the *Union Sacrée* and with rising prices and official government encouragement given in return for labor's support of the war doubled the trade union membership at the same time that it substituted the tactics of regular trade unionism for those of syndicalism. Superficially it still adheres to the *Charte d'Amiens*, but in practise since the failure of the syndicalist general strike of 1920 the French labor movement has tended more and more to follow the tactics of western European unionism. Both collective bargaining and legislation have been employed by the unions since the war.

Although the *Confédération Générale du Travail* remains the dominant economic group, the French Communists, organized in a separate union as the *Confédération Générale du Travail Unitaire*, have exercised on the industrial field a far greater influence in France than in any other capitalistic country. Catholic unions have also become significant since the war. A fourth group, syndicalist in nature, is insignificant. The best organized industries are those which are either semipublic, such as mines or railways, or entirely owned and operated by the government. Except in large centers the workers in private industry are largely unorganized, although they are often class conscious in the continental radical sense.

Despite the fact that France was the leader in antipolitical syndicalism socialism always has been influential with the French working man. As early as the general election of 1893

the socialists had fifty deputies and the majority control in many municipalities. Nationally and officially the Socialist party endorses the *Confédération Générale du Travail* and the whole cooperative movement. The C. G. T., which relies more and more on legislation and on government aid, finds that it must take an active part in politics. In doing so it definitely regards the Communists and the right parties as hostile and in practise restricts its political neutrality to the Socialists and the bourgeois parties of the left. The prevailing sentiment, however, in the higher circles of the C. G. T. is that the Socialist party is controlled by extremists who are not in sufficient contact with the trade union movement. On many questions, such as the capitalistic "rationalization" of industry, there is a difference of opinion. The Socialist party is lukewarm if not hostile to it, whereas the C. G. T. is wholeheartedly in favor of it. In accordance with the non-political tradition of French unionism even the communist unions are not officially related to the Communist party although they are in practise.

Unlike England, the United States and Germany, where capitalism developed at so rapid a pace that workers were unable even in groups to embark on production, in France capitalism developed at a comparatively moderate pace and producers' cooperatives of workers exist side by side with similar enterprises of capitalists. But by the end of the nineteenth century as a result of the increasing difficulty in obtaining credit and the growth of class consciousness consumers' cooperation had outdistanced that of producers. Since the war cooperation has moved in step with the newer economic development of France away from the isolated neighborhood cooperative to the chain store type of merchandising, with centralization in buying and with factories owned by the wholesale cooperatives. The *Banque des Coopératives de France* became the central financial organ for the movement. From its beginning the cooperative movement had been aided by the French state. It is the best customer of producers' cooperatives and in legislation has favored them against private competitors by the decree that where the bid is the same the contract goes to the cooperative.

The Italian labor movement prior to the World War had both a political and an economic wing. The former was split into three factions: the reformists, inspired by the revisionism of Bernstein; the "integratists," led by Ferri, who re-

sembled the German Social Democrats of that period; and the syndicalists under Labriola, who severed their connection with the Socialist party in 1907 and who did not become an important group until the war. The reformists split with the Socialist party in 1912 because of their desire for war; they became a part of the Italian nationalist movement which the war with Turkey over Tripoli in 1911 had stimulated. The divisions in the trade union movement followed those in the political movement. There were four different organizations: the Union of Industrial Workers, the Union of Agricultural Laborers, Chambers of Labor and the Catholic Union. The last was a small group and opposed to the other three (socialist) organizations.

The labor movement was from the beginning concentrated in the north. In the region of the Po river there developed a type of capitalistic farming with hired laborers and among these, but especially among the urban workers, socialism flourished. The movement was revolutionary to such an extent that the government under Giolitti prior to and during the World War was forced to compromise its previously conservative position in the interest of maintaining peace. This policy (*trasformismo*), by which the government tried to be all things to all men, prevailed down to the Fascist Revolution.

During the war the Socialists under Ferri remained to a large extent pacifistic. When the peace treaties gave Italy little in reward for her participation in the war on the side of the Allies, the Socialists had an important talking point; and the closing down of the war industries, the rise in the cost of living due to the rise in foreign exchanges, and the example of the Russian Revolution all contributed to turn the whole trend of labor toward revolution. This took the form of syndicalism, general strikes and occupation of industries and landed estates by the workers.

The movement soon failed, however, partly as a result of a lack of plan of organization, an inability to obtain credit and to market products but primarily because of the development of a well organized terroristic strike breaking organization in the form of Mussolini's Fascisti. The apparent purpose of the Fascist reign of terror was the suppression of trade union, cooperative and socialist organizations and it was for this reason that the movement secured financial support from the manufacturers, bankers and landlords. The establishment of Fascism was gradual; by 1925 it was fairly

well completed. In the following year the voluntary syndicates and trade unions were replaced by a nation wide compulsory scheme of syndicate organizations, which alone were recognized as legal. Four main classes of syndicates were set up: capitalists, agriculturalists, laborers and professional men. Each person in order to carry on a business or get a job must belong to one of these syndicates and pay dues to it. The syndicates, organized on a local, regional and national basis, with officers approved by the dictator, have made rules fixing wages and even output. Although the employers and employees were at first separately organized, the national Fascist federations of employers and employees were later combined into corporations.

Fascism embodies the negation of the class war; its essential principle is class collaboration and the substitution for the struggle between classes within the nation of the world struggle between nations. The interest of the workers, according to Fascist principles, ends at the national boundary; except for the quasi-governmental International Labor Organization no connections are permitted between labor organizations in Italy and similar organizations in other countries. Strikes and lockouts are forbidden under the law of 1926, which also provides for giving legal validity to all labor contracts. To enforce and interpret the contracts a system of labor courts is provided.

Class collaboration is therefore the supreme doctrine of Fascism. This is illustrated by the Labor Charter of 1927, which states that there is no conflict of interests between the various classes; that they work together for the greatest production and for the welfare of the nation; that private initiative is the most useful instrument for the welfare of the nation; and that the state interferes in production only where private initiative is lacking. While theoretically the Fascist state is formed out of functional economic groups organized into syndicates and corporations, economic groups are not paramount; instead the state is controlled by a relatively small political group organized on a military basis representing no economic class but recruited from the petty capitalists.

In Soviet Russia the situation is quite different. Here the labor movement is perhaps younger than that of any other important European country. For a longer period of time than elsewhere in Europe trade unions, except bogus organizations formed and controlled by the police, were illegal in Russia. Genuine union or-

ganizations nevertheless did develop despite the restrictions, particularly among the printers. The revolution of 1905 brought a promise of the legalization of trade unions, which resulted in a remarkable growth in union organization. But governmental control of these unions was still strong and contributed to the success of a drive by the employers which materially weakened the union movement. Russia entered the World War with a weak trade union movement; and when the revolution came, it was the social philosophy of the revolutionary socialist and communist parties which dominated rather than any wage conscious unionism.

The communist revolution was almost strictly an urban and wage earners' revolution based on the soviets, which were merely the central labor unions of the locality, a kind of organization which has arisen in all countries at periods when unionism is just beginning. Such were the trade unions of England and America in the decade of the 1830's; the soviets had already appeared in Russia in the short revolution of 1905. Springing up again after the February revolution in 1917 they represented a great variety of organizations and included "intellectuals" of various sorts. When the defeated veterans returned to St. Petersburg they were admitted to the soviets, which then became Workers' and Soldiers' Councils. Lenin and Trotsky advocated and effected the exclusion from these new soviets of the intellectuals and of those who, like the Mensheviks, favored trade union agreements and collaboration with employers; the soviets were then converted into proletarian organizations bent upon the destruction of the capitalist system.

It is an important fact, as Calvin Hoover has noted, that whereas competition for wealth is paramount in a capitalist country, competition for political power within the Communist party has taken its place in the Soviet Union. This competition really means a competition between political policies and has centered chiefly around the question of how far private or communist ownership of industry and agriculture may be permitted. The struggle on this point still continues but under the administration of Stalin there is a strong drive toward the entire prohibition of all private ownership and private trading. The labor movement of Russia has thus culminated in the most extreme doctrine of a classless government controlled solely by the class of propertyless wage earners.

Where Fascism definitely limited the activity

of its labor movement to the boundaries of Italy, Russian communism started from the principle that the revolution must be made world wide and must be continued until all the world has accepted communism. But the force of internal conditions and the stubborn resistance of capitalists in Germany and England as well as the development of Fascism in Italy and Germany have forced the Soviet Union to abandon the principle of world revolution in return for an opportunity to build its own national commonwealth. It now seeks world peace and feels that engaged as it is in the process of "building socialism" it would be the principal sufferer from a war. The political Communist International and the economic Red International of Labor Unions are still in existence and still function, but their revolutionary activities have been considerably circumscribed by the internal needs of Soviet Russia.

Fascism and communism, antithetical in their ultimate ideals and in their standards of value, present certain striking similarities in their practical consequences for the labor movement. The Soviet Union too has abolished the class war within the nation, not by the submergence of existing class interests but by an attempt to eliminate all classes. The dictatorship of the proletariat embodying the concept of a continuation of other classes is to be eliminated when the profit psychology has been eliminated—when all the people are workers and none lives by interest, rents or profits. In both Italy and Russia the edge of the class struggle has been dulled by government control of the policy and administration of the former voluntary trade unions and cooperatives. This has been done by the simple device of securing the appointment of members of the Fascist or Communist parties as officers of these associations. In addition in both countries the function of the trade unions has ceased to consist of representing the workers in conflicts with employers, and they now act as agencies for increased efficiency and productivity. In both cases they have become instruments for enforcing governmental policy.

In addition to the emergence of communism and Fascism, which have affected the form and functioning of the labor movement not only in the countries of their origin but in other countries as well, one of the most important developments of the post-war world has been the capitalism of the United States. Here the economic method of labor action has predominated over

both the political and the cooperative, because the overlordship of the aristocratic state and the church has been eliminated for more than one hundred years. The electoral suffrage began to be extended to the wage earners in the decade of the 1820's, full fifty years in advance of the countries of Europe. In the United States capitalism has had its greatest freedom of development; both capitalism and labor organizations have followed along clear cut economic lines.

Although American union activity has been essentially economic—directly through trade unions—there have been periods when labor has turned to other lines of action. As early as the end of the 1820's labor with its newly acquired franchise turned to political action to secure its ends. Parties which were distinctly labor developed in various eastern cities, but their practical proposals were stolen by other parties and they were left with the advocacy of radical measures which brought them into disrepute. In the period before the 1850's labor again turned to legislation, although not through independent action; such measures as public education, mechanics' lien laws and homestead laws received the general support of labor movements. With the organization of strong national trade unions after 1850 labor once more concentrated upon economic action. But not until the 1890's did this business unionism finally win out over the type of labor program which had been proposed by various early labor organizations in the United States, ending with the Knights of Labor, and which had attempted by voluntary association to substitute cooperation and self-employment for capitalistic employment on the democratic principle of one man one vote instead of the capitalistic principle of one share one vote. These organizations frequently broke down on the one issue of electing managers by popular vote. Or if they succeeded they passed over into capitalistic organizations by closing the doors to new members and hiring non-members for wages. The experience of the molders and the coopers with producers' cooperation ended this phase of the American labor movement, although in 1919 the railroad unions offered to assume partial control of the railways under the Plumb Plan.

American labor activity has not entirely eschewed political action, but it has refused to enter the political arena as an independent party or to cooperate in the formation of an independent labor party. Except for 1924, when

the American Federation of Labor supported La Follette for president, the official labor movement has tended to adopt the policy of supporting now one party, now the other, according to the benefits expected from the one or the other. This policy of rewarding friends and punishing enemies has been employed, however, primarily to insure the freedom of action of trade unions on the economic field and to secure the passage of certain measures which could not be attained through union action, such as workmen's compensation and immigration restriction. As for substantive contributions to the direct well being of the workers, such as social insurance laws, the American Federation of Labor has consistently opposed their passage, believing that these benefits should be provided or secured by the unions, thereby making the union member dependent upon his union only and not upon his employer or the government.

In line with its conservative non-political policy the American Federation of Labor has carefully and consistently avoided any socialist or communist affiliations and has even been prominent among the attackers of these social philosophies. Except for the year 1895, when the socialist sympathizers captured the presidency of the A. F. of L. and unseated Gompers, left wing groups have been unable to make any appreciable headway with the organization. Both boring from within and dual unionism have failed to make much impression on the movement as a whole, although individual unions, such as the International Ladies' Garment Workers Union, have been severely crippled by internecine fights between the communists and other members. Some unions and some sections have either openly supported socialists or communists or have actively participated in the formation of labor parties; but the movement as a whole has carefully avoided any such action and even in the depression election of 1932 the American Federation of Labor, although disappointed with the labor planks in the platforms of the two major parties, refused to support either the socialists or the communists.

Unionism in America received a tremendous impetus through the high prices and the prosperity of the war years. In the ensuing periods, however, membership declined—not only in the depression of 1920-21 but also in the prosperity period which lasted until 1929. The trade unions which do exist in America are still powerful—possibly more so than those in Europe. But capitalism in the United States seems to

have developed new methods of resistance to the spread of unionism. Diffusion of corporate ownership, labor legislation and voluntary concessions by giant corporations have apparently rendered unionism unnecessary to many of the workers. Large scale business has been forestalling unionism by providing for labor as much as or more than the unions offer. Another obstacle to the growth of a strong labor movement is the important system of promotion, which still offers outlets for members of the working class and hampers the development of class feeling.

Important contributing factors to the limited extent and the non-radical nature of American unionism were the areas of free land available in the west until the end of the nineteenth century and the successive waves of immigration, which complicated the problem of union organization by introducing racial and national antagonisms augmented by language difficulties. In the period before the World War it was relatively easy for large employers to replace groups which had learned to think collectively by new immigrants unaccustomed to the philosophy of unionism, anxious to get a start in a new country, pleased at the relatively high wages and unapproachable by the spokesmen of the older groups because of language difficulties. As fast as one group rose out of this state it was replaced by a new group. With the practical exclusion of immigrants after the war the problem of language barriers became less important. Regional shifts, such as that of the textile industry to the unorganized south, present new problems and the presence of a large Negro group, which the rank and file of organized labor has thus far almost consistently refused to admit, constitutes a perennial strike breaking menace, which has already given rise to such fundamentally economic outbreaks as the race riots in East St. Louis in 1917.

These two elements of free land and immigration, which would seem to be the common characteristic of new countries, were not present in the unique Australian labor movement. Faced from the beginning with a concentration and monopolization of landownership and consequent difficulty of rising beyond his status as a wage earner the Australian laborer has always been conscious of a scarcity of opportunity. This factor together with a homogeneity of culture arising from a common English ancestry, an early attainment of universal suffrage and the realization through experience that the government

serves the "master class" in any industrial disputes has led labor in Australia to resort to independent political action. At the close of the nineteenth century labor with the acquiescence or support of other groups moved for compulsory arbitration after the failure of an intense opposition to the strikes of the miners, shearers and maritime workers.

The Australian Labour party, which includes the parties of the various states, has steadily broadened its platform in the interest of the trade unions which dominate it. Having established compulsory arbitration in the commonwealth, New South Wales, Queensland, South Australia and Western Australia, it has attempted to establish union preference in the courts of arbitration; to maintain the self-sufficiency of Australian industry by high tariffs; and to achieve socialization of industry by a constitutional utilization of the federal, state and municipal governments. While no progress has been made in instituting a system of union preference in the courts, high tariffs have been effected and Australia has socialized her industry to a greater degree than any other capitalistic country in the world. With the support of the party trade unionism in Australia has steadily been strengthened, so that in 1931 about one half of all employees were members of unions. The courts of arbitration have been responsible for much of this growth, because they recognize as parties to disputes only those workers who are organized and they do not permit employers to discriminate against union members.

Because Australian capitalism has always been employer capitalism, unionism in Australia has tended to develop along industrial lines. An example of this is the Australian Workers' Union, comprising for the most part shearers and other agricultural workers, which is the largest and perhaps strongest union in Australia and constitutes one sixth of the total union membership. The Australian Council of Trade Unions, representing the bulk of union membership outside the Australian Workers' Union, has consistently urged the organization of labor along industrial lines and the formation of one big union.

But the characteristic feature of Australian unionism has been the creation of a "White Australia" by exclusion of all races and nationalities except the Anglo-Saxon. In many countries the division along racial and national lines has been more important than division along

economic lines. In countries where a single nationality predominates, such as Germany, England and Australia, race consciousness supports the labor movement and trade unions and political parties are more easily formed.

It is not surprising that when capitalist organization becomes international, the labor movement follows. This was a basic fact which Marx recognized in aiding the organization of the International Working Men's Association in 1864. But Marx' organization preceded by half a century the banker capitalism which is to be considered as the real beginning of international capitalism.

The international labor movement is at present made up of over seventy organizations divided into various systems of "tendencies"—socialist, communist, syndicalist and Christian—in addition to the quasi-governmental International Labor Organization (*q.v.*). Of these the International Federation of Trade Unions (or Amsterdam International, as it is known from the location of its central offices, which, however, were moved to Berlin after 1930) is still the largest and most coherent despite its decline in membership since 1921. It is composed of twenty-seven international trade secretariats made up of trade unions of the socialist type, is allied with the political Labor and Socialist (Second) International and cooperates with the International Labor Organization. Its membership of over 13,000,000 includes a majority of the trade unionists of Europe and some outside of Europe, although the American Federation of Labor is not represented. The federation withdrew in 1920 because, according to Gompers, the International had "become an international political body with sovietism as its logical result and a revolutionary program for 'socialization' and 'communism'." Some American national trade union bodies, however, continue to belong to the international secretariat for their industry.

The trend of Amsterdam is to merge the socialist ideal with the ideas of "workers' control" and of industrial democracy; its outlook is reformist internationalism, which regards the transition to a socialist society as a gradual and slow process. It conceives its main task to be one of promoting economic and social reforms under capitalism. The twenty-seven secretariats are little more than information bureaus and discussion centers. On the other hand, the need for international action is causing the miners' secretariat to support regulation of

the mining industry through an international commission. The metal workers, faced by the growth of international cartels, are backing a demand for an international cartel office under the League of Nations.

The communist Red International of Labor Unions was established in 1921 as a successor to the Provisional Council of Red Trade Unions, which was organized by the Third International in 1920 to break up the Amsterdam International with its definite socialist affiliation. The Red International of Labor Unions is organically connected with the Third International. The great majority of its membership is of course located in Russia.

The Christian trade unions which developed after the issuance of the papal encyclical *De rerum novarum* in 1891 organized an International Secretariat of Christian Trade Unions in 1908, which before the World War reached a membership of over half a million, more than two thirds of which was located in Germany. The war interrupted its activities, as it did those of the other labor internationals. It was reconstituted after the war and now has a membership of about a million and a half. Essentially its purpose is to try to allay industrial unrest and to establish economic justice on Christian principles.

The anarchist International Working Men's Association, which adopted the same name as Marx' First International as a sign of its claim to spiritual descent from that body, is the least important of the international organizations, with a membership of only a few hundred thousand.

The labor movement is thus seen to be amazingly complicated and diverse. There is scarcely a single principle or permanent trend underlying it except the aggressive principle of encroaching upon the domain of capitalism. Even this principle is in abeyance during a war for national survival or conquest. The movement in one country is not comparable with the movement in another country, and even in the same country it changes with transformations in the form and power of capitalism and in all the social movements.

Within the movement itself there are many conflicting trends, which weaken its aggressiveness; these range all the way from communism, syndicalism and unionism to cooperation, and they are broken up again into many different forms and temporary combinations. In some countries one or more of these conflicting internal movements rises to temporary predomi-

nance, while in other countries quite the opposite movements may predominate.

The modern world wide extension of markets together with the emergence of international combinations has correspondingly expanded the scope of the labor movement, which, however, has lost ground relatively to world wide capitalism. Racial and national differences have made the movement in one country different from that in another country where one language and one race may tend to effect an automatic solidarity. Differences in wages and standards of living have had an equally important part in the fluctuations of labor movements, and the cycles of full employment and unemployment have weakened them more than any other factor. Nevertheless, with the rapid improvements in technology, with the transition from an agricultural to an urban population and with the corresponding shift from small property owners to propertyless wage earners the labor movement by mere weight of numbers becomes a major problem of western civilization.

| BRITISH DOMINIONS | HERBERT HEATON |
| UNITED STATES | J. B. S. HARDMAN |

GENERAL. In popular usage the term labor party serves to cover labor associations organized to ameliorate the lot of working people by political and legislative action as distinguished from capitalist reform parties on the one hand, and socialist or communist parties on the other. Within that usage the term further denotes a membership composed primarily, if not exclusively, of working people and a pragmatic eclecticism of program, free from commitments to any integrated social philosophy.

More accurately, existing labor parties may be divided into three categories according to their organization and membership. First, there is the English type, consisting primarily of trade unions which affiliate with the labor party en bloc and vote as units. In addition individual union members and others, whether or not they are workers, may affiliate through local labor or socialist parties. The Labour party of great Britain has ordinarily embodied the largest degree of direct trade union affiliation of any labor party; in Australia also trade union members constitute the great bulk of party membership. The second is the Belgian type, a permanent triple alliance of the Socialist party, the trade unions and the cooperatives, which most closely approximates a formal socialist party with respect to acceptance of the theoretical tenets of socialism. The Socialist party maintains an autonomous existence within the Belgian Labor party not dissimilar to that which the Independent Labour party held within the British Labour party until 1932. Third, there is the American type, which finds organized expression in only one state but appears in several other states in the form of more or less significant local parties. Such parties consist neither of organized trade unions nor overwhelmingly of individual trade unionists but of persons of divers social and economic origins. They view their own efforts as but initial steps toward the inevitable formation of a labor party of the country's trade unions. Wherever they have attained a measure of success or maintained a more than passing existence these American attempts have been dominated by a farmers' or agrarian outlook.

In their basic attitudes toward the social

order the functioning labor parties are divisible into two groups: European and American. Nearly all the former are at present at least theoretically anticapitalist, while the latter are at most anti old parties or anti big interests. Early attempts to form labor parties in the United States were outspokenly radical, however, even though the radicalism was of an agricultural brand; at a time when the intellectual remains of Chartism were being entirely absorbed by avowedly socialist groups and English laborism was tamely evolving into Liberal-Labourism, an active labor radicalism which sought political expression still existed in the United States. The organizations of the 1870's bore a socialist stamp: the International Working Men's Association, the First Socialist International, stood guard over their activities, and such men as William H. Sylvis and F. A. Sorge maintained an active correspondence with Marx and Engels.

The theoretical distinction between the typical social democratic or communist party on the one hand and a labor party on the other is that the former rest upon a social creed or ideology while the latter is based merely upon a social class. The socialist or the communist claim to labor representation rests upon the ability of the given party to generalize and effectively to voice presumably existing working class aspirations. The claim of a labor party would seem to need no substantiation, for its very appearance on the scene represents its credentials. The appealing attractiveness of a labor party in the eyes of workers seems to rest upon simplicity of performance—"act in politics as you act in the factory"—as well as upon its implied capacity for action, since a labor party has direct access to labor's organized power through the constituent trade union bodies.

The play of political and social forces has conditioned the emergence of socialist or creed parties in certain countries and of labor or class parties in others. In the light of these circumstances three major types of relations between the trade unions and the political movements stand out in the experiences of European labor. In Germany, the other central European

countries and the Scandinavian states there developed a parallelism of the economic and the political organizations. Their essential equality as well as the mutualism of immediate and ultimate interests was considered a matter of course. The Socialist party enjoyed acknowledged leadership in political matters but the trade unions steadily if tacitly materialized and extended an "encroaching control over the whole movement." The battles for universal and direct franchise and democratic rights generally and for social and labor legislation kept the two divisions of organized labor in a working relationship.

In France, which is industrialized only in certain sections, developments took another course. The economic hollowness of most of the political gains of the French Revolution, the ruthless suppression of the Commune and the frequent cases of "treason of the intellectuals" who used labor's readiness to respond to radical political appeals as stepping stones to personal parliamentary careers caused the development of a strong antipathy to political action and of anarchistic tendencies in large sections of the proletariat, especially in Paris, where small shops and petty industry rather than large scale establishments flourished. Trade unions were not assured of legal status until 1884, and trade unionism or syndicalism therefore acquired a revolutionary glamour. The rift between the socialists and the trade unions grew. The local central labor councils or exchanges (*bourses du travail*), under direct anarchist leadership, housed in buildings erected out of municipal funds and in other ways publicly supported, became centers of opposition to party politics, mainly directed against the socialist party. This trend was essentially similar to the political course of the American Federation of Labor under Gompers; it is significant that when Gompers visited Paris in 1909 the French revolutionary syndicalists received him as their very own. In time, however, a partial *entente cordiale* was established between the party and the unions under the compelling influence of the moderate socialist leader Jean Jaurès as well as of the big reformist unions which were interested in legislation—including those in the industrialized north, in the textile industry and in the railroad industry, partly under government control. A similar relation with certain variations existed in the other Latin countries.

In Great Britain two basic circumstances pre-

vented the formation of a strong socialist movement. The struggle for the franchise was virtually won as early as 1867, when the Reform Bill gave voting rights to city workers. In that struggle the Whigs, or Liberals, supported labor. The anti-union combination laws were repealed in 1871; and an effectively built trade union movement enabled at least the upper strata, the skilled workers, to secure some benefits from the preferred position which British capitalism enjoyed in the markets of the world. The major causes which generally aided the development of the continental socialist parties—the fight for suffrage, the struggle for social and labor legislation and the economic misery of the workers—did not operate in quite the same way in the United Kingdom. Here the two-party political system and the role of relative economic progressivism which the Liberals, the party of expanding finance and industrial capital, played against the party of the land magnates, the Tories, tended to keep labor indifferent to political socialism, with the result that while many doctrinaire and sectarian socialist groups developed, no substantial socialist party arose. Only when unskilled labor rose to organized influence, beginning with the dock workers' movement, was the stage set for the active and independent entrance of labor into the political arena. Reactionary decisions of the law courts, notably the Taff Vale decision in 1901, hastened the progress of the movement. But only by relegating its socialist ambitions to the background was the Independent Labour party able to make itself a force in the acceleration of the evolutionary course which resulted in the formation of the Labour party.

Except for the Belgian Labor party, which in a practical sense merely represents the German system of close cooperation between socialism and trade unionism developed to the point of federation, pre-war political labor activity took two forms: socialist or social democratic partyism, recognized to a greater or lesser degree by industrially organized labor, and labor partyism, based on direct trade union affiliation as in the United Kingdom and the dominions, especially the Irish Free State, Australia and New Zealand. The distinction between the two rests upon the degree of control exercised by the trade union movement and the political party. Even the maximal acceptance by the Social Democracy of the trade union viewpoint in all matters of policy and of theory as affected by it at no time brings the party to

the point of being a mere "labor caucus" of the trade union movement, as the British Labour party has always been. Even the revision of the constitution of the Labour party in 1918 and the invitation to the "workers by brain" to join did not change matters materially. Some of the intellectuals who answered the call may have received comfortable appointments and probably enjoyed gratifying publicity, but in substance they remained expert if well remunerated servants of the trade unions acting through the party. On the other hand, the intellectuals in the continental socialist and communist movements dominate their parties.

The difference in basic control has resulted in different general political and social characteristics. The Social Democratic and Communist parties maintain an active interest in national and international matters, in intellectual or cultural issues and in social theory and their behavior in crucial situations is determined by these interests. The course of the Labour party, on the other hand, has generally been determined by the trade union outlook, and the immediate concerns of the trade union organizations have at all times directed labor party policy. Thus in the matter of relations with Soviet Russia the socialist intellectual leaders of the British Labour party were obliged to subordinate their own partisan animus to the pragmatic concern of the trade unionists with the problem of employment. In the crisis of 1931 the attack by the parliamentary majority on the unemployment insurance system precipitated the Labour party's refusal to "carry on" the government. The members of the Labour government quit office by direction of the trade union leadership on a straight labor issue, whereas the Social Democratic party in Germany despite its anxiety to work with the trade unions let its policy be guided by a desire to "save the republic." The democratic, or the revolutionary, outlook has been the dominant consideration of socialism or communism in politics, while the class, or the economic, viewpoint has been the first concern of laborism.

J. B. S. HARDMAN

GREAT BRITAIN. Although an organized working class with large class conscious sections existed in Great Britain long before it did in any other European country, the British Labour party is a generation younger than continental socialist parties. Efforts to bring English workers into politics during the reform struggles in-

spired by the French Revolution left behind only some suggestive literature and a list of martyrs to savage repression. In the 1830's such men as Bronterre O'Brien urged on workers the necessity of winning political power, but after the decline of revolutionary Chartism in the middle of the century most British workers accepted capitalism, then in a definitely progressive stage with expanding imperial and foreign markets, as inevitable. They shared with the Victorian middle class a faith in thrift, individualism and nonconformist religious doctrines. For individual self-improvement they looked to literary institutes, for economic advance to collective bargaining. Labor in general was aware of a social rather than of an economic cleavage between "the classes and the masses." Remembering the quasi-feudal servitude under which their fathers had lived before the industrial revolution, workers were more critical of landowners than of capitalists. Robert Applegarth in advocating an extended franchise represented perhaps the height of political interest among trade unionists of his generation. When in 1867 Sheffield workers put up a parliamentary candidate they chose Anthony Mundella, a Liberal manufacturer, on a "class harmony" platform. Labor was content to pursue the Liberal party, through which miners supported by compact groups following a hereditary trade secured an appreciable number of parliamentary seats. The trade union movement as a whole concentrated on immediate issues, mainly of wages and hours, and exerted only an indirect political influence, greatly to the satisfaction of Liberals, who regarded it as a force for "rational conservatism" and a bulwark against independent labor politics.

Modern socialism in England originated among middle class intellectuals. William Morris and H. M. Hyndman, who founded the Social Democratic Federation in 1881, were pioneers in preaching class consciousness and independent labor politics but never won a numerous following. More important and typical was the Fabian Society, founded in 1883, to which belonged such intellectuals as Sidney and Beatrice Webb, Bernard Shaw and H. G. Wells. The Fabians were "gradualists" about the transfer of industry to public ownership, relying on persuasion and statistics and tending to idealize the bureaucrat. They were anti-Marxist and antirevolutionary, decried the class war and were inclined to be imperialists. Their first strategy (soon abandoned) was to "permeate" the Liberal party. Although the society never had a working

class following, its publications, especially the *Fabian Essays*, gradually sapped Victorian individualism and complacency among the middle class youth and later among workers, thus laying an intellectual and emotional basis for independent labor politics. Among other influences which made the Labour party one must reckon the *Clarion*, a lively weekly edited by Robert Blatchford, whose *Merrie England* (London 1894) was the most popular of socialist books.

In 1874 the Labour Representation League and a decade later the Labour Electoral Association succeeded in electing Labour candidates to the House, but both were rapidly absorbed by the Liberal party. The work of founding a proletarian organization devolved on Keir Hardie (q.v.), a miner who realizing the limitations and costliness of isolated strike struggles turned first to Liberal and later to Labour politics as the alternative. His ethical socialism based on an ideal of service was well calculated to win workers prepared by a chapel upbringing. In 1893 he founded the Independent Labour party and soon gained Philip Snowden and Ramsay MacDonald, both of working class origin, as lieutenants.

Rising prices after 1896 and the demand for higher wages favored the growth of a militant "new unionism," which after the turn of the century began to combat the "labor aristocracy" (skilled and relatively well paid craft unions), aiming at a wider industrial unionism and the organization of the unorganized. The Trades Union Congress adopted some socialist resolutions and the I. L. P. (as the Independent Labour party was always called) began to put up candidates for Parliament. Although for years the new party had to meet the objection that it split the progressive vote, its persistent election fights served to propagate its ideas. In 1892 and 1900 Keir Hardie was returned to the House, where his tactics did much to convert workers to the idea of a labor party.

Inasmuch as the I.L.P. had made many enemies through its missionary activities, it was unacceptable as a basis for a new national party. Instead the trade union practise of sending members to Parliament was generalized and made the basis of the new party. It was founded in 1900 as the Labour Representation Committee and after 1906 was called the Labour party. Unlike continental socialist parties, which are based upon individual membership, the Labour party was a federation of unions and the three socialist societies; as a result it at once acquired status as

well as funds through a levy on union members. But it had many weaknesses. Although it insisted that its conception of labor included brain workers as well as hand workers, it was, compared with the German Social Democracy, always poor in intellectuals and organized intellectual life. It had for years no party press and the *Daily Herald* still does little to popularize socialism. The mass of unionists were never converted to socialism, and many who would answer a strike call would vote Liberal or even Tory. The unions, which provided most of the campaign funds, usually nominated as candidates administrative officials, who were unusually dull in the House. A growing strain was put on the loyalty of the I.L.P., which, although it did most of the organizing and propaganda, was so small as to be subject to the domination of any bloc of three or four large unions. In recent years this structural fault in the Labour party has been partially repaired by the creation of an individual membership section.

Although the I.L.P. spread socialist propaganda within its ranks, the Labour party remained for long under the spell of Liberal tradition. Its motive force was not so much socialist ideas as a demand for independent working class representation. Until after the World War an unavowed alliance often enabled its candidates to escape Liberal opposition, and in Parliament they did little more than follow the Liberal lead in social reform, the constitutional struggle with the Lords and efforts to confer home rule on Ireland. They supported Liberal budgets, including military appropriations, and generally acted like a left wing of the Liberal party.

A series of bitter strikes beginning in the South Wales mine fields in 1905 and culminating in the formation in 1913 of the aggressive Triple Alliance of miners, railway men and transport workers stimulated a feeling of class solidarity which the World War submerged but did not obliterate. Since the generation of workers reared in liberalism was dying out, Lloyd George's formation of the war coalition completed the disillusionment of the workers. By the enfranchisement of women and the simplification of the electoral qualification the electorate was more than doubled in 1918 and further increased in 1929. Under Arthur Henderson the Labour party built an efficient electioneering machine. All these developments aided the party, and its vote grew rapidly.

In August, 1914, MacDonald backed almost unanimously by the I.L.P. took a pacifist posi-

tion. The Labour party declared an industrial truce and eventually joined the war coalition, although it advocated a peace of conciliation. MacDonald lost the leadership of the Labour party and in the "khaki" election of 1918 he and Snowden and most of their pacifist followers lost their seats. At the end of the war the representatives of the strengthened I.L.P. left the Socialist International for the Vienna International, coming back again in 1923.

LABOUR VOTE AND LABOUR REPRESENTATION IN HOUSE OF COMMONS, 1895-1931

| YEAR OF ELECTION | LABOUR VOTE | LABOUR VOTE AS PERCENTAGE OF TOTAL | LABOUR MEMBERS ELECTED |
|------------------|-------------|------------------------------------|------------------------|
| 1895* | 44,594 | 1.2 | 0 |
| 1900† | 62,698 | 1.9 | 2 |
| 1906 | 323,690 | 4.8 | 29 |
| 1910, January | 505,690 | 7.5 | 40 |

* I. L. P. vote.

† Labour Representation Committee vote.

The chief drama of the Labour movement was now played outside the House. The post-war revolutionary ferment in England took the form of quasi-political strikes, a form as old and as English as Robert Owen. British labor followed the Russian Revolution with friendly interest, agitated against the blockade and contemplated a strike in 1920 against the government's plan of military aid to counter-revolutionary Poland. Lloyd George's failure to act on the report of a royal commission in favor of coal mine nationalization led to the miners' strike in 1921, which proved disastrous when railway men and transport workers influenced by J. H. Thomas failed to go out in sympathy. There was at this time some contact between Moscow and left wing Labour and a small, active Communist party was formed. But although the Russian Revolution gave an emotional stimulus to English labor and aroused much sympathy, the main body of the Labour party held to gradualism and reformism. At and after the election of 1918 the Labour party worked for a minimum standard of life; that is, for the abolition of gross poverty through social reforms differing only in degree from recent Liberal legislation. In 1922 and 1923 along with some leading Liberals it concentrated

on the proposal of a capital levy. It was in earnest over nationalization only for the coal mines.

In 1922 the party under MacDonald became second in number in the House and acquired the rights of His Majesty's Opposition. In 1924 by an accident inevitable under a three-party system Labour came into office. Snowden produced an orthodox Gladstonian budget. Schemes of wage fixing for agricultural labor and for promoting workers' housing were adopted. The outstanding record was MacDonald's at the Foreign Office. He recognized the Soviet Union and in association with a left French government restored European peace after the Ruhr occupation. Since as a minority government it was prevented from doing anything of which the Liberals disapproved, the Labour government observed all the conventions, respected the monarchy and like Tories and Liberals followed behind the scenes the guidance of a singularly adroit civil service. After nine months the Tories exploiting the forged Zinovieff letter created a Red scare during the general election and Labour was defeated despite the gain in prestige which resulted from its first period in office.

Interest now again centered in the unions. The left expressed its inclination to "direct action" in the general strike of 1926. This was without serious revolutionary intention and was but a bluff of the Trades Union Congress which the government forced it to make good. The defeat of the strike threw the movement back on opportunism and restored MacDonald's ascendancy. The party expelled all communists and adopted a frigid attitude toward Russia. The I.L.P., which had outgrown its ethical attitude, worked out a program to cope with chronic unemployment, to rationalize backward industries and agriculture and to initiate the transition to socialism through the ballot by capturing for the community control of the main keys to economic power, especially banking. MacDonald suppressed this program and substituted an incoherent compilation of reformist projects.

The party's automatic growth continued and it returned to Parliament in 1929 with a plurality. Few adherents of the Labour party can think of its second period of office without shame and disgust. MacDonald treated the Liberals with a new cordiality, his habit of consulting the opposition serving as preparation for coalition. The key cabinet position, a kind of dictatorship to cope with unemployment, went to Thomas, who took to repeating the usual reactionary excuses

for doing nothing for the workers. Snowden, as chancellor of the Exchequer, fell obviously under the influence of the bankers and vetoed credit expansion and any bold program of public works, such as even the Liberals had advocated.

The legislative machine worked with exasperating slowness. Conditions of widows' pensions were improved, a bill on Liberal lines rationalized the mining industry, another promoted orderly agricultural marketing. Outstanding successes were once more in foreign policy with Henderson now at the head of the Foreign Office: MacDonald's conciliatory visit to Washington, the London Naval Conference, the restoration of diplomatic relations with Russia, the removal of the French from the Rhineland, the signing at Geneva of the optional clause for arbitration. Tory policy was abandoned in India and the Round Table Conference summoned. But there was no coping with the main problem. Although the government's policy was open to a wider attack, the I.L.P. concentrated chiefly on criticizing the inadequacy of relief provisions.

In the summer of 1931 a vast foreign loan was needed to halt a run on the Bank of England's gold reserves. Prompted apparently by the Bank of England, American bankers refused to lend unless the disordered budget were balanced by drastic economies, including specifically a cut in unemployment relief. The Labour cabinet, while sparing armament appropriations, was willing to economize by devastating the social services and by reducing the pay of all civil service grades. When a cabinet majority refused, however, to give a signal for general wage reduction by cutting the dole, MacDonald (now a distinguished individual without a party) accepted the king's invitation to form a "National" coalition with Tories and Liberals. The Labour movement on the whole accepted the secession of MacDonald, Snowden and Thomas with relief, realizing rather tardily that they had long since been absorbed by the governing class.

The general election that followed brought on the Labour party a disaster unprecedented in English history. The challenge to the money power which was implied in the Labour party's project for control of banking caused the combined opposition of Liberals and Tories to be ranged against it. Its former leaders deliberately created a financial panic. MacDonald jettisoned a life long belief in free trade. Snowden assailed as "Bolshevism run mad" legislative proposals for the nationalization of the Bank of England which stood in draft in his handwriting.

Ill prepared and ill led for the fight the party was routed and, although its total vote showed only a 20 percent reduction, it came back to the House a remnant of its former self, only two members of the late cabinet escaping the deluge.

Since the election of 1931 the Labour party has struggled to build up a reliable mass membership of individual adherents. The discussions leading to the revised program which was laid before its annual conference in 1932 revealed a swing to the left and an attempt to work out something more than the familiar compilation of uncoordinated proposals for social reform. The party now realizes (as the I.L.P. did before it) that any advance to a planned economy presupposes the effective command of the state, involving public ownership in most cases, over the key positions which confer economic power. The events of 1930-31 have led the party to concentrate upon finance. All agree that the Bank of England must be nationalized; some would nationalize the joint stock banks also; the majority would be content to control them. It is further proposed to set up a national investment trust under public control which would direct the flow of savings into socially useful channels in accordance with a definite plan of development and at the same time penetrate industry, acquiring a measure of control through the new capital which it distributed. The party's monetary policy aims at a moderate, controlled inflation and prefers a commodity standard to any return to gold. The other key positions chiefly in view are the coal industry and electricity, regarded as a single complex, the railways and road transport and agricultural land. In the tariff controversy the party has abandoned free trade dogmas as relics of *laissez faire* but is suspicious of tariffs and would prefer to control foreign trade partly through disinterested public boards, which would directly import wheat, meat and eventually raw materials with a system of licenses and quotas for other goods. It is generally realized that a radical program of this kind would involve a sharp struggle with the financial interests and with the House of Lords, and some influential leaders have said that they will not again assume office without a majority in the Commons. This attitude if firmly held would mean that the party refuses (as some put it) "to administer the capitalist system" and is now consciously bent on engineering the transition to a socialist society. The party has, however, a right wing to which belong some of the older leaders, the "machine" and its one newspaper, the *Daily Herald*; there is even a section (prob-

ably insignificant in numbers) which would welcome MacDonald's return as leader. The ablest of its younger leaders, Sir Stafford Cripps, the best debater in its small parliamentary contingent, belongs emphatically to the left.

The feud which developed in Parliament during the second Labour ministry between the I.L.P. and the official party has resulted in the secession of the former. The Labour party insisted on stricter discipline in the Commons and imposed standing orders which, while allowing a member in a case of conscience to abstain from voting, forbade a direct vote against the party. One might have supposed that the departure of the national leaders would have healed this feud, especially since the question of voting is of no importance in a parliament like that following the 1931 elections, in which the Labour representation is very small. Both sides, however, have shown an unyielding temper, the I.L.P. insisting that standing orders must be modified, the Labour party requiring that the five I.L.P. members must rejoin the party before this can be discussed. The consequent decision of the I.L.P. to disaffiliate places it in the same position of hostile detachment as the Communist party and may weaken Labour at the next election. The underlying reason for the I.L.P.'s action appears to be its suspicion of the leaders and the main body of the party who tamely followed MacDonald up to the final split over the dole.

H. N. BRAILSFORD

BRITISH DOMINIONS. All the dominion labor parties have been created by the trade unions. They owe very little to continental socialism, for their ideas have been imported from the general stock of British liberalism, Fabianism and other programs for democratic and social reform, combined with elements of Ruskin, Morris, Henry George, Robert Blatchford, Wells and Bellamy and in later years of guild socialism. These influences, however, were little more than a top dressing to a body of aims based on local labor problems. The real task of the labor parties was to secure through political effort those improvements in labor conditions which could not be obtained by direct trade union action or by pressure upon the old political parties. Once launched, they found that they must have views on issues which were not strictly labor problems, such as defense, finance, the conduct of the World War, tariffs, the native problem in South Africa and the nationalist

controversy in Ireland. Some of these problems have more than once caused serious splits in the parties. Finally, a party which has captured the government has found that the obstacles to socialization are so large, the resistance by second chambers is so tough, the machinery of legislation and administration so slow to move, funds for ambitious social programs are so difficult to obtain, that rapid and heroic achievement of party aims has had to give way to "the inevitability of gradualness."

The history of the Australian Labour party, the only dominion party to reach full stature and to enjoy the opportunity to shape legislation and administration, affords the best illustration of these general statements. Before any labor party existed Chartist ideas had given Australia advanced democratic machinery, the need for railways had led to state construction and management, the fear of racial mixture and the strength of the trade unions had secured laws against Asiatics and for the protection of wage earners, while land problems had led the state to experiment in the interest of the small farmer settler. Trade unions were content to negotiate directly with employers, to bring pressure to bear on politicians and to toy with the notion of direct labor representation. But the strike of 1890 and the years of depression and anti-union activity which followed smashed the union machinery, decimated its membership, induced employers to withdraw concessions they had made to the unions and revealed the fact that in a serious conflict the full strength of the state was at the disposal of "the master class" as long as that class controlled the government. Australian labor therefore turned to political action. In the New South Wales election of June, 1891, 36 out of 45 Labour candidates were elected. Success came soon in other states, and in the first federal election in 1901 the Labour party won 16 seats out of 75 in the House of Representatives and 8 out of 36 in the Senate. Universal adult suffrage for both houses helped to make this result possible, while payment of members freed the party from the cost of maintaining its representatives.

Once the party had won more than a handful of seats in any legislature it held the balance of power; its support was then given to whichever of the older parties would make the highest bid. Some important legislative and administrative gains were thus made, but the position was unsatisfactory to all parties. By 1909 therefore Liberals and Conservatives had fused in

common defense against "the socialist tiger," and the Labour party became the official opposition. The next step came with the winning of an absolute majority; this happened in the commonwealth in 1909 and in New South Wales in 1910, and by 1915 Labour was in power in every lower house but one. The conscription issue tore the party to pieces in 1916; those leaders who favored compulsory military service joined with their Liberal opponents and the rest of the party continued as an ineffectual opposition. Labour returned to power later; by 1925 it ruled five states and in 1929 the party captured the federal government. The depression which began in 1929 divided the party again; those leaders who were determined to balance the budget and strengthen the country's impaired financial condition by drastic economies went over into the enemy's camp and the bulk of the party again passed into eclipse. By 1932 Labour had lost control everywhere except in Queensland and had split into two groups. After the federal elections of 1931 the moderate group held 8 out of 36 seats in the Senate and 14 out of 75 in the House; the left wing group led by Lang, former New South Wales premier, 2 seats in the Senate and 4 in the House.

The success of the Australian Labour party rested largely on its organization and program. The trade unions provide a firm foundation in a land where town dwellers constitute nearly two thirds of the population and where a larger proportion of the population than in any other country are unionists. Every unionist is a member of the party through his union; non-unionists may join the party through local branches, which are good centers for information and conversion. The candidate for a particular area is chosen in a "preselection" ballot by the unionists and branch members in the area; this system provides an opening for local talent and ambition. An annual party conference in every state, consisting of delegates chosen on the preselection ballot, offers a chance for the democratic framing of the party program for the state. The state conference elects delegates to the Australian party conference and also chooses a state executive, which is the essential controlling power between conferences. The Australian conference usually meets triennially and since 1915 also has elected an executive to function between conferences. The problem of control of the parliamentary members was raised at an early date and tight discipline has been kept through the "pledge" and the functioning

of the party caucus. All candidates who offer themselves for the preselection ballot must promise not to oppose the candidate selected and, if elected, to vote as the caucus determines. The caucus consists of all Labour members of both houses and meets generally at least once a week. It thus permits the members of one house to influence action in the other and at the same time usurps the usually dominant position of the premier over the cabinet. The caucus chooses and controls the cabinet and is itself more or less effectively controlled by the executive and the conference. The development of Labour's organization has altered fundamentally the previous regional decentralized character of Australian political parties and the functioning of parliamentary government in Australia.

Labour's program was not doctrinaire and had few abstractions; it included a set of trade union "planks" and aimed to secure democratic governmental machinery, "equality of opportunity" in education, heavy taxation of the rich, the breaking up of underutilized large estates, the protection of wage earners from exploitation, the safeguarding of infant industries and of the high standard of living against foreign competition and the strengthening of Australia's political and constitutional status within the British Commonwealth of Nations. In such a comprehensive program there was something to attract all classes except the ingrained conservative and the old fashioned employer; and since Labour in office showed itself quite as statesmanlike as did its opponents, it won the vote of a large section of the middle class. On paper it declared for a new social system, for "socialization of the means of production, distribution, and exchange" through parliamentary action. But few steps have actually been taken in that direction, and with one or two exceptions—of which the outstanding was the establishment of the Commonwealth Bank in 1911—little has been done to reduce the field of capitalistic enterprise. At best there has been an increasing regulation of private ventures or the establishment of services to aid the farmer; at worst there have been some costly experiments in state production and trade, and socialism is little nearer after forty years of talk and trial. With the achievement of its early "practical" nationalistic planks Labour has been increasingly forced to turn to international socialism for its immediate program as well as its ultimate ideal; the result has

been to alienate considerable sections of its former essentially liberal but not socialist supporters.

In New Zealand as in Australia an unsuccessful strike in 1890 and a continued depression together with revelations of "sweating" led the workers to demand labor legislation and protective tariffs. This program was largely shared by the Liberal party, consisting essentially of small farmers, which was always in close touch with labor and courted its vote. In the elections of 1890 six trade unionists were elected as Labour candidates within the Liberal party, and from 1891 until 1906 the Liberal-Labour party ruled the country, passing important land, labor and state socialistic legislation. But the recovery of farm prices in the first years of the twentieth century accentuated the divergence of interests between the farmers and the workers, and the combination of these two against the large landowners showed increasing signs of disintegration. Beginning in 1902 the trades and labor councils began to agitate for an independent labor party, but the break did not actually occur until Seddon's death in 1906. A series of organizations culminated in the formation in 1912 of the United Labour party, a moderate party opposed to the class war principle. By 1928 the party held the balance of power with 20 seats in a house of 80 members; but in 1931 the two old parties fused into a United-Reform party and Labour became the opposition, facing the coalesced farmers and capitalists. The elections of 1931 gave Labour 24 out of 80 seats in the House.

In the Union of South Africa the task of organized labor is to protect the white worker against the big mining company above and the native laborer below, with the Dutch farmer looking on. Soon after the South African War English immigrants who had known British labor developments began a Labour party on the Rand. The drastic handling of the strikes in 1913 and 1922 by General Smuts strengthened the party's cause and drove it in 1923 into an alliance with the Nationalists; the latter agreed to modify their plans for an autonomous republic, while Labour promised to be silent about socialization. The alliance overthrew Smuts and his party in 1924, and Labour took 2 seats in the new government. But the party executive growing suspicious of the alliance asked the ministers in 1929 to relinquish their portfolios. They refused, were evicted from the party and formed their own Labour group. An unsuccessful

attempt to close this schism, which weakened Labour at the 1929 election, failed in 1931.

In pre-war Ireland the political allegiance of organized labor was divided between the Irish Nationalists and the British Labour Representation Committee (subsequently the Labour party), with the southerners in general favoring the former and the northerners the latter. Gradually, however, labor sentiment drifted away from the Nationalists. In 1912 the Irish Trades Union Congress endorsed the principle of a pledge bound Irish Labour party and in 1914 its constitution was amended and its name changed to make it a Labour party also. Its political activities were practically dormant during the World War, and it did not contest any parliamentary seats in the elections of 1918 and 1921 but supported the republican candidates; it did, however, contest local and municipal elections with marked success. With the establishment of the Free State the Labour party entered the parliamentary field in the 1922 elections and won 17 of the 128 seats in the Dail. The party has fought strenuously for improved labor conditions, and while it supports national autonomy it seeks to damp down the flames of controversy and give Ireland peace in which to progress. For instance, when the 1932 elections shifted power from Cosgrave to De Valera but left Labour holding the balance, with 6 out of 60 seats in the Senate and 7 out of 153 in the Dail, Labour voted with the government to abolish the oath of allegiance but did its utmost to discover a peaceful settlement of the dispute between London and Dublin.

Canadian labor like that of the United States has done little party building on a large scale. It has passed resolutions urging or opposing legislative and administrative action and has lobbied. But it is too weak in numbers and class consciousness to enter politics with any force, and the left wing has been absorbed by the grain growers. During the World War the ferment of ideas on reconstruction led the central executive of the trade union movement to recommend the organization of provincial labor parties, and this was done in six provinces. Some success followed; in 1921 two Labour members were elected to the dominion legislature, while in Ontario and Manitoba a farmer-labor onslaught captured many seats. The federal representation has not grown and ground has been lost in the provinces, but in some municipalities the party has significant strength.

HERBERT HEATON

UNITED STATES. The first labor party in the United States and in the world was the Working Men's party launched in 1828 by the Mechanics' Union of Trade Associations of Philadelphia. In the next few years the example was followed in New York, New Jersey, New England and states west. These early labor parties were quite radical in their demands and social outlook. They were aware of the position of labor as a class in the social order and their legislative demands were aimed at furthering the interests of workers. Their social objective, however, was to achieve a middle class status for labor and their ideal was a society of small manufacturers, merchants and farmers. It was through their efforts, even if indirectly, that the public school system was established, imprisonment for debts abolished and mechanics' lien laws and homestead laws were enacted. The intellectuals played an important part in these movements. European Owenism and Fourierism found active followers in Albert Brisbane, Frances Wright, Robert Dale Owen and later Horace Greeley. Internal dissension over principles, however, destroyed the Working Men's party in New York even before the depression of 1837 crushed unionism. Intellectual utopianism, middle class aspirations and agrarianism are perhaps a peculiar amalgamation to be found in a labor movement, yet in the prevailing economic and social set up of the time the development had a logic of its own. The shifting frontiers of the country prevented economic solidification of classes on the lower rungs of the social ladder. It has been correctly observed that an independent labor politics which is free from entangling outside alliances has really never been tried in the United States.

About fifty years after the first local and sporadic attempts at labor party building significant efforts were again made to harness the potential political power of labor to class ends. The National Reform party was created in 1872 by the National Labor Union, a central federation representing local, state and national trade associations somewhat similar to the later American Federation of Labor; at its peak the union was reputed to have a membership of 640,000. The party, which was not only representative of labor but also socially radical in terms of the America of the day, did not last. The experiences throughout the stormy 1880's, which saw the rise of the Greenback Labor party in 1880 and of the United Labor party under the domination of Henry George in New York in 1886,

a period marked by the Haymarket disaster, a growing anarchist movement and battles all along the line between the Knights of Labor, the socialists, the Populists and the A. F. of L., resulted in what seemed a final abandonment of all hope of labor partyism. The activist and class conscious labor elements bent on using independent labor politics in the class struggle reconciled themselves to limited functioning within a party of creed instead of a party of class. The Socialist Labor party was established, then was split and largely superseded by the Socialist party, which in turn was split and greatly weakened by the Communist party. Not until the end of the World War did there appear signs of a regenerated interest in a labor party. The first labor party of the new period arose in Bridgeport, Connecticut, in 1918 as an after effect of the machinists' eight-hour movement. The movement, which assumed national proportions in 1919 but disappeared again in 1925, was the result of two major factors—the phenomenal if temporary rise of the United States as an agricultural produce exporting country and the impact upon American labor of forces and influences which followed the war.

Stimulated by the war prices spurted upward, improving the position of the independent farmers but also stimulating large scale farming based on control of transport facilities, grain elevators and credits. The small farmer facing a rapid loss of his independence turned for aid to group but not collectivist cooperation and to independent farmer politics. The National Non-partisan League, a defense apparatus of small and middle farmers, entered politics class consciously in 1916 through organized participation in Republican and Democratic primaries and soon developed spectacular strength; by 1918 it had secured a majority control in the legislature of North Dakota and impressive minorities in Idaho, Minnesota, Montana, South Dakota, Colorado and Nebraska. The league became a party in fact if not in name. The logic of its growth, with the relentless fight against the league by the parties of corporate capital, made a farmer-labor alliance logical and necessary. A working relationship seemed the more possible, since the league was led by men of socialist background and experience, for in Minnesota especially the socialists had achieved not inconsiderable standing in the pre-war years.

Trade union labor experienced an organizational and an intellectual revival during the war years. The first resulted in a considerable

growth of trade union membership. The second was more intensive than extensive. The repercussions of the Russian and German revolutions stirred American labor profoundly. The phenomenal rise of British labor to political significance inspired the younger subordinate leaders in the trade union hierarchy; they saw in independent political action a leverage against the older men whose stock in trade or power not infrequently consisted only of the advantages of an illicit political alliance with the old party machines. A political labor party would give the new man a place in the sun, would tend to dislodge holdover leadership. Some unions, especially those whose membership was generally radical, as, for instance, the coal miners' union, were committed to the idea of a labor party. In other cases, as in that of the transportation unions, economic action was almost impossible except by way of political pressure. The year 1919 was a banner year for left orientations in the United States. The gigantic steel strike; the general strike in Seattle, Washington; the Boston police strike; the miners' nation wide strike, which was crushed by an abrupt and drastic interference of the federal courts at the instance of the government and at the behest of the mine operators, were but instances of the chain of events which set in motion an enormous psychological transformation. On January 11, 1919, the American Labor party of Greater New York was organized by delegates of the local trade unions. In May of the same year the Pennsylvania State Federation of Labor declared for independent political action, to be followed in September by similar action in Indiana. In April the Illinois body at its annual convention took steps to form a state labor party. On November 22, 1919, the National Labor party was launched.

In all these movements local and state union officials took an active part along with direct representatives of the rank and file, while national union heads were conspicuously absent. The American Federation of Labor as such was entirely opposed to the movement. In 1920 the Farmer-Labor party succeeded the National Labor party, running candidates for president and vice president under that party name. The vote the party received was very disappointing. Of the more than 4,000,000 workers who participated in the mass strikes of 1919 and of the many sympathizers who followed the strike movement with anxious interest only 265,411 voted the Farmer-Labor party ticket in 1920.

This setback did not, however, altogether end the careers of the various state and local parties. Another effort, of a different orientation, was in progress. It took the shape of a Conference for Progressive Political Action (C. P. P. A.), a somewhat loosely organized body of numerous national trade unions, local, state and national labor parties, including also the Socialist party but not the Communist party. The C. P. P. A. was organized in February, 1922, and soon became the storm center of the issue of independent political action. Opposition to the traditional inactivist political policy of the A. F. of L. doubtless chiefly motivated the participants in the C. P. P. A. There unanimity ended. The majority of the C. P. P. A., led by the powerful railroad brotherhoods, favored an active non-partisan policy and operation through old party primaries where possible, feasible and promising.

Numerous attempts by the adherents of independent labor action to form an impressive national farmer-labor party through the forces gathered around the C. P. P. A. failed, and the organization went no further than to run Senator Robert M. La Follette and Senator Burton K. Wheeler on an independent Progressive ticket in the 1924 presidential election. The Socialist party stood by the ticket. The Executive Council of the A. F. of L. half heartedly endorsed the ticket with the stipulation that it was endorsing the two men but not their Progressive party or any prospective independent party. La Follette polled 4,822,856 votes, or 16.6 percent of the total of 29,091,417 votes cast. The C. P. P. A. survived the election just long enough to prepare its demise. The convention of 1925 adjourned without fixing another meeting date. The labor party movement once more went into eclipse.

In Minnesota, however, there has existed since 1920 a functioning political labor organization, the Farmer-Labor party. It grew out of an informal merger of two forces which were at one time influential: the Socialist party in the cities and the National Nonpartisan League. After many structural and political zigzags the organization succeeded in lining up the trade unions for steady joint action with the farmers and has thus been firmly established as a significant factor in the political life of the state. In 1932 there were in office, elected by the Minnesota Farmer-Labor party, the governor (from 1930), one senator (from 1922), one congressman (from 1928), about one third of the two houses of the state legislature and the

mayors of four cities, among them the three largest in the state. Generally viewed as the potential nucleus of a national farmer-labor party and with its leaders openly upholding that view, the Farmer-Labor party nevertheless endorsed the Democratic presidential candidate in 1932. The Minnesota experience in its application to certain vital points of contention bears out the conclusions of Rice: "In . . . Minnesota, the data are convincing that farmers and working men have supported the same candidates . . ." and that "Should questions involving political reform, public utilities, or the rights and privileges of labor or agriculture become dominant issues . . . there seems a possibility (on the basis of our legislative data) that a successful political alliance between these classes might develop" (*Farmers and Workers in American Politics*, p. 183 and 219-20).

The only other labor party in the United States which claims a state wide jurisdiction is the Independent Labor party of Pennsylvania, although its existence has been altogether nominal. Recent attempts to form local labor parties include the following: the Labor party of Cook County, Illinois, organized in 1930, largely on adjunct to the Socialist party; the Independent Labor party of Kanawha valley, West Virginia, created by the independent West Virginia Mine Workers' Union after the failure of its strike in the summer of 1931; the Independent Labor party in Philadelphia, sponsored by the American Federation of Full Fashioned Hosiery Workers in that city and hardly distinguishable from the local Socialist party; the Labor parties in Kenosha, Wisconsin, in New Bedford, Massachusetts, and in Elizabethton, Tennessee, all passing outgrowths of workers' resentment against strike defeats.

These labor parties which appeared after the breakdown of the "prosperity era" may be and probably are representative of unexplored potentialities but, save in the Minnesota case, they are symptoms at best and not active factors. There is still no functioning national political labor party in the United States. Furthermore the registered membership of all the socialist or creed parties, however potentially valuable it may be considered as an organizing force, is rather negligible and is in no wise comparable to the strength of the continental working class parties whether they be socialist, communist or labor.

LABOR TAX. See FORCED LABOR.

LABOR TURNOVER. The fluctuations in the working force within an industrial establishment may be divided into two main classes: first, an increase or decrease in the size of the working force and, second, the hiring of workers in numbers sufficient to maintain the working force at a given level. One group of students would confine the use of the term labor turnover to the second of these meanings and consequently considers replacement as identical with turnover. Replacements correspond roughly with accessions if the working force is decreasing and with separations if it is increasing; it is this use of the term which has been adopted by the United States Bureau of Labor Statistics. Another group, however, holds that separations constitute the more important phenomenon and should be used to measure turnover in a contracting as well as in an expanding working force. This group considers that labor turnover is a problem of the instability of employment, and that all separations regardless of replacement contribute to the instability of employment.

Labor turnover is essentially a manifestation of maladjustment. A limited amount of turnover, expressing the mobility of labor, is unavoidable;

but in its abnormal and acute forms labor turnover is an element of industrial waste. The worker suffers from insecurity and depreciated earnings, while the employer is harassed by higher labor costs; society meanwhile is deprived of available labor and potential wealth. All the causes of excessive labor turnover—seasonal and cyclical fluctuations, conditions within an enterprise which produce separations, and partly the instability of labor—are indications of faulty economic and social organization.

For comparative purposes it is necessary to reduce the absolute figures of turnover to percentages. This can be done by dividing either replacements or separations by the average number exposed to turnover. The National Association of Employment Managers in the United States once proposed to use as the denominator the average number actually employed during a given pay period. This measurement was defective, however, because it omitted the absentees, who were certainly exposed to turnover. To meet this difficulty it was proposed that the average number on the pay roll should be used as the denominator, although this was in turn objected to by Brissenden, who pointed out that it would include men who were on the pay roll but who had left the employ of the concern before the pay period expired.

The earliest modern studies were made in Germany and published in the *Schriften des Vereins für Sozialpolitik* in 1909 and 1910. In the United States public attention was first attracted to the problem shortly before this country's entrance into the World War, in part because the shutting off of immigration forced American industries to conserve their labor supply more carefully and in part because of the relative scarcity of labor during the period of American participation in the war. Another contributing factor was the upward movement of money wages, which operated unevenly and which necessarily led many workers to leave their jobs in order to obtain higher earnings in others. Studies by Slichter indicated an average turnover rate in American manufacturing in 1914 of approximately 100 percent, while wartime studies by the Bureau of Labor Statistics showed an average turnover for 1917-18 in the firms studied of approximately 200 percent.

These and other studies, notably that by Alexander, helped to awaken American industries to the losses which they were experiencing as a result of the high turnover rates. The advent of new workers to replace the old generally in-

volved added costs, of which the most important were expense in hiring and training, wastage of material and breakage of tools and machinery, increased labor and overhead costs resulting from decreased production, and idle overhead in the period before the replacement actually took place. One of the most tangible evidences of this increased concern on the part of industry was the stimulation which it gave to the establishment of personnel departments. The functions and powers of these departments varied greatly, but at their minimum they were designed to aid in the recruiting of labor and in the greater stabilization of the working force.

The depression of 1920-21 brought about an appreciable decline in American labor turnover rates. With the much greater stabilization of money wages, the improved personnel policies of employers and the increasing displacement of labor by improved efficiency which characterized the years from 1923 to 1929 this new level was generally maintained. An extensive survey by the United States Bureau of Labor Statistics of selected factories in not fewer than seventy-five industries in the boom year of 1929 showed an average turnover rate of only 45 percent.

While little or no material has been published on the subject in Great Britain, it seems probable from the number of unemployment insurance cards which are returned annually to the British employment exchanges in comparison with the numbers covered by the insurance act that the average percentage of labor turnover in that country in recent years has been between 50 and 60 percent. In 1922 the British Industrial Health Research Board published a study of labor turnover during the war in munitions and other factories, which was considered merely suggestive because of war conditions and the fact that the workers covered were almost exclusively women. The methods of measuring labor turnover were so diverse that it was extremely difficult to compare one factory with another; even in large establishments turnover was said to be "not infrequently a subject of conjecture rather than precise measurement." A more uniform system of measuring turnover was proposed by the board. The study revealed that the turnover rate was unusually high in the first months of employment and that it varied with locality, industry, the age of the worker and the nature of his work and factory conditions (as distinct from seasonal and cyclical factors). The board suggested that labor turnover might be reduced by more attractive wages, shorter hours and better

working conditions. In recent years there has been considerable interest in the subject in Soviet Russia because of the large flow of labor from plant to plant and the high turnover in the coal and iron industries of the Donets basin. The causes of labor turnover in Soviet Russia are in many respects different from those in other countries; for example, seasonal and cyclical factors apparently do not operate to any considerable extent.

Turnover rates are of course not uniform but vary widely as between different classes of labor and differing industries. Unskilled labor, for instance, has generally a much higher rate of turnover than has skilled. Thus Brissenden and Frankel found a percentage rate for skilled workers from 1913 to 1915 of 60 and for unskilled of 129, while in 1917-18 the respective percentages were 135 and 427. A study at the University of Chicago of the turnover rates in various occupations in a large middle western railroad in 1920 showed a variation between 19 percent for telegraphers and nearly 1700 percent for freight station laborers.

As would be expected, heavy industries, where the work is inclined to be less skilled and in addition is often unusually arduous and disagreeable, tend to have rates of turnover above the average. Thus in 1917-18 the following industries had a turnover rate of over 200 percent: automobiles, chemicals, leather and rubber, miscellaneous metal products, slaughtering and meat packing and furniture and milling. Mercantile trade, on the other hand, in both the war and the pre-war periods had turnover rates which were only two thirds of the average. Still lower were the rates in the public utility companies, where the prospect of steady work retained a far more stable working force despite the failure of wage rates during the war and post-war period to advance as rapidly as elsewhere. In the public utilities studied by the Bureau of Labor Statistics in 1913-14 gas and electricity companies had a turnover of only 15 percent, street railways 27 percent and telephone service 39 percent. While these rates increased greatly during the war they remained very much below the general average. The turnover in governmental service is particularly low. Even in the years 1917 to 1919, when federal salaries were lagging far behind the increase in the cost of living, the turnover of federal employees did not exceed 40 percent. A more recent investigation by Brissenden for the entire federal service in 1927-28 showed an average annual turnover of 19 percent, while in

the departmental services in Washington, D. C., the average was only 8 percent. In general it can be said therefore that in industries and occupations where the principle of seniority is commonly followed for both promotions and layoffs the turnover rate tends most decidedly to be below the average. This is also measurably true among organized workers, where union rules, such as the priority system and limitation of the employer's right of discharge, tend to reduce considerably the turnover of labor.

A common objection by industrial managers to the employment of women has been that a concern cannot be sure of their services for as long a period of time as it can in the case of men. It is of course true that because of marriage and motherhood women do not as a rule remain in industry for so long a time as men and thus do not have equal opportunity to rise to the more skilled positions. There is no evidence to indicate, however, that during the period in which they are gainfully employed they are more unstable than men. On the contrary, while it is difficult to make comparisons between the sexes because of the differing types of work which they perform, such evidence as does exist seems to indicate a lower turnover rate for women than for men. Thus in the stores studied by the Bureau of Labor Statistics in 1917-18 the percentage for women was 81 as compared with 144 for men. In the clothing and textile industries the relation between the two sets of rates was very similar: 129 percent for women and 204 percent for men.

It should not be thought, however, that the average worker in industry moves from job to job with the relative degree of speed which all of the above figures might indicate; the bulk of the turnover is concentrated in the minority of short service workers, thus leaving the majority to be employed for longer periods with very much lower turnover rates. It was found, for example, that in fifty-three establishments which in 1917-18 had an average turnover of approximately 133 percent five eighths of the working force had been employed throughout the preceding year and the entire turnover had come from the remaining three eighths. The average for this latter group as a whole was therefore approximately 360 percent. The relative concentration was still greater in the case of those employed less than three months. Only 5 percent of the male workers at the end of a year in a group of companies had been employed for less than two weeks, but nearly 29 percent of all the separations

during the year involved men who had been on the pay roll only for that time. This was a separation rate therefore of approximately six times that for the employees as a whole. The group which had been employed for from two weeks to one month formed in turn only 4.3 percent of the work force but had comprised 13.2 percent of the separations, and while those workers who had been with the companies for from one to three months constituted only 9.7 percent of the total force, 21.2 percent of those who had left had worked only during this period. At the other end of the scale 35 percent of the force had been employed for over five years, whereas only 3.6 percent of those who separated had been employed for that period of time. This was only one tenth of the general average.

The causes of labor turnover may be divided into those which are proximate and those which are more ultimate. Since it is separations which give rise to replacements, an analysis of their composition throws light upon the more proximate causes. Separations may be classified according to three main subdivisions. First come layoffs, when the services of the worker are supposedly satisfactory but there is no longer a job to be performed. While in the short run those who identify turnover with replacements would not regard these cases as truly giving rise to turnover they would so regard them if a seasonal or cyclical revival were to demand their replacement. The second class of separations covers discharges; here the job itself is to continue, but the worker is adjudged unsatisfactory for it. Third, there are the voluntary separations, in which the worker himself takes the initiative in leaving. In practise the distinction between the first two of these divisions is frequently blurred by the management and men are often said to be laid off who are really discharged, and the reverse. Similarly many men are considered to have left a job voluntarily when in reality they had merely estimated in advance the probable intentions of management toward them.

Of these direct causes of turnover voluntary separations formed 73 percent of the total during the years from 1910 to 1915 and 1917 to 1918, while discharges and layoffs comprised 16 and 11 percent respectively. But these proportions have of course varied with the progress of the business cycle. In depression years, such as 1914, the percentage of layoffs rose and that of voluntary separations fell, while in years of prosperity, such as 1917-18, exactly the opposite happened. The rate of discharges was much more

constant. These same variations prevailed from 1918 on, although there may be a general tendency for the proportion of voluntary separations to be less even in prosperous times than it was in the World War and in pre-war years. This development in turn may have been caused by the much greater stability of money wages as well as by the rapid increase of separations due to the installation of labor saving machinery.

Among the more underlying factors of separations three general groups of causes may be found: first, those which result from faulty management and can be largely remedied by each individual concern; second, those caused by more deep seated difficulties in industry as a whole, which are largely beyond the power of any one enterprise to alter; and, third, those due to difficulties in the circumstances and temperament of the workers themselves.

The first group includes a wide variety of causes. In the war and post-war periods the loss from improper hiring was emphasized and the hope was expressed that job analysis, which would disclose the qualities needed at a given task, and trade and psychological tests, which would reveal the present trade knowledge and capacities of the workers, would make possible far better selection and thereby reduce the turnover. Such tests, however, have been used only to a very limited extent and predominantly for clerical rather than for manual workers. On the other hand, there can be little doubt that there has been a distinct improvement in the relations between the supervisory force and the rank and file. This has been due in part to the efforts of many businesses to train their foremen in their duties as well as to the very general establishment of personnel departments. These departments not only centralize the preliminary hiring of labor (subject generally to review by the foremen) but also exercise some degree of control over discharges and aid in the adjustment of grievances. The net result has been that friction between the workers and the supervisory staff has been diminished. More attention is also paid to the problems of satisfactory adjustment of newcomers to their work and to arrangement for transfers, so that workers may if possible find the jobs for which they are best fitted. A further important factor in diminishing labor turnover has been the lessening of general wage fluctuations as well as the tendency of large corporations to adopt a more united wage policy and of other concerns to watch the movement of money wages more closely and to keep their rates more

nearly in correspondence with the prevailing scales, thereby lessening the movement of workers from lower wage to higher wage plants. By these and other means, such as the establishment of shop committees, group insurance, old age pensions and employee stock ownership, "welfare" capitalism has been able to diminish labor turnover. That an improved personnel policy will in fact generally operate to reduce turnover is indicated by the fact that the average rate of turnover for the seven years from 1913 to 1919 inclusive was 69 percent in ten concerns with well established personnel systems, as compared with an average of 111 percent for all other establishments studied by the Bureau of Labor Statistics for this period.

Far less success has been attained in reducing those seasonal and cyclical fluctuations which cause men to be alternately laid off and reemployed. Much attention has been drawn to the regularization practises of such firms as the Packard Automobile Company, Proctor and Gamble, Dennison and Company and a number of others. These firms were successful in greatly reducing seasonal slumps by the device of estimating sales in advance on the basis of past experience and then dividing these minimum yearly quotas into even monthly or weekly portions. More is produced in the dull months than can then be sold and this surplus is stored for the coming of the busy season. Another method which is sometimes used is the development of side lines or "fillers" upon which the working force can be engaged in the off seasons. The firms which have been successful with these methods have found that they are advantageous not only because the cost of labor turnover has been reduced but also because overhead capital charges have been lessened. In many cases workers have been satisfied to receive a lower hourly wage, which, however, as a result of steady work brings a higher yearly income.

Because of a few successes in stabilizing employment it has sometimes been claimed enthusiastically that all American businesses can stabilize their production and employment if they so desire. This seems to be a great exaggeration. Upon examination it will be discovered that stabilization has been successful almost exclusively in concerns producing standardized commodities which can be stored without fear that they will be outmoded by the time the busy season comes again. The case is far otherwise with those commodities which are subject to such changes. In the case of women's clothing,

for example, it is impossible for manufacturers to produce in advance. Thus it is those industries which are most subject to style changes together with some in which weather fluctuations cause especial havoc that suffer most from seasonal variations in employment. Moreover many heavy industries find it difficult to store products or to produce supplementary products; such production is usually done by a subsidiary and the problem of turnover is thus left unsolved.

In so far as cyclical fluctuations are concerned it is even more impossible for individual businesses to stabilize employment. The causes of the business cycle are so interwoven with the cumulative expansion and contraction of bank credit, with the way in which the demand for capital goods necessarily fluctuates far more widely than the demand for consumers' goods and with the ever present danger that specific sets of industries will get out of line with the development of the economy as a whole that an individual concern is largely helpless. The problem of labor turnover is therefore not simply one of management and of separate concerns but of industry as a whole and can be solved only by collective action.
